Recommendation of statin therapy

Recommendations for Lipid-lowering Therapy in Patients with Established CAD

ACC/AHA guideline: High-intensity statin therapy

atorvastatin 40/80 mg, rosuvastatin 20/40 mg, or simvastatin 80 mg

Previous "More versus Less" Statins Trials

Cholesterol Treatment Trialists' (CTT) Collaboration. Lancet 2010; 376: 1670-81.

4 statin benefit groups

Acute coronary syndrome History of MI or angina, Coronary or other arterial Revascularization, stroke, TIA, PAD

- 1. Patients who have cardiovascular disease (clinical ASCD*)
- 2. Patients with an LDL level of 190 mg/dL or higher
- 3. Patients with DM who are between 40 and 75 years of age
 - (LDL-C 70 to 189 mg/dL)
- 4. Patients with an estimated 10-year risk of cardiovascular disease of 7.5 % or higher who are between 40 and 75 years of age (the repo rt provides formulas for calculating 10-year risk)

ASCVD = Atherosclerotic cardiovascular disease Clinical ASCVD is defined by the inclusion criteria for the secondary prevention statin RCTs (acute coronary syndromes, or a history of MI, stable or unstable angina, coronary or other arterial revascularization, stroke, TIA, or peripheral arterial disease presumed to be of atherosclerotic origin).

2013 ACC/AHA Blood Cholesterol Guideline based on Statin Therapy

High-Intensity	Moderate-Intensity	Low-Intensity		
Statin Therapy	Statin Therapy	Statin Therapy		
Daily dose lowers LDL−C	Daily dose lowers LDL–C	Daily dose lowers LDL–C		
on average, by approximately	on average, by approximately	on average,		
≥50%	30-50%	by <30%		
• Atorvastatin (40†)–80 mg Rosuvastatin 20 <i>(40)</i> mg	 Atorvastatin 10 (20) mg Rosuvastatin (5) 10 mg Simvastatin 20–40 mg[†] Pravastatin 40 (80) mg Lovastatin 40 mg <i>Fluvastatin XL 80 mg</i> Fluvastatin 40 mg bid <i>Pitavastatin 2–4 mg</i> 	 Simvastatin 10 mg Pravastatin 10–20 mg Lovastatin 20 mg Fluvastatin 20–40 mg Pitavastatin 1 mg 		

Statins and doses that are approved by the U.S. FDA but were not tested in the RCTs reviewed are listed in *italics*.

† Evidence from 1 RCT only: down-titration if unable to tolerate atorvastatin 80 mg in IDEAL

[‡] Although simvastatin 80 mg was evaluated in RCTs, initiation of simvastatin 80 mg or titration to 80 mg is not recommended by the FDA due to the increased risk of myopathy, including rhabdomyolysis.

ACC: American College of Cardiology. AHA: American Heart Association. LDL-C: low-density lipoprotein cholesterol. RCT: randomized controlled trials. FDA: Food and Drug Administration. U.S: United States of America

Management of Dyslipidemia

Statin Safety Recommendations

Recommendation					
Safety					
 To maximize the safety of statins, selection of the appropriate statin and dose in men and nonpregnant/nonnursing women should be <u>based on patient characteristics</u>, level of ASCVD* risk, and potential for adverse effects. Moderate-intensity statin therapy should be used in individuals in whom high-intensity statin therapy would otherwise be recommended when characteristics predisposing them to statin-associated adverse effects are present. Characteristics predisposing individuals to statin adverse effects include, but are not limited to: Multiple or serious comorbidities, including impaired renal or hepatic function. History of previous statin intolerance or muscle disorders. Unexplained ALT elevations >3 times ULN. Patient characteristics or concomitant use of drugs affecting statin metabolism. >75 years of age. Additional characteristics that may modify the decision to use higher statin intensities may include, but are not limited to: History of hemorrhagic stroke. Asian ancestry. 	A (strong) There is high certainty based on evidence that the net benefit† is substantial.				

Does High-Intensity Pitavastatin Therapy Further Improve Clinical Outcomes?

The REAL-CAD Study in 13,054 Patients With Stable Coronary Artery Disease

2017 ACC/AHA guideline limitation

However, the high-intensity statins are not widely used in daily clinical practice, particularly in Asia. No clear evidence regarding "more versus less" statins has been established in Asian population. Most of the doses of high-intensity statin therapy defined in the ACC/AHA guideline are not approved in Japan. Furthermore, maximum approved doses of statins are prescribed only very infrequently in Japan.

Therefore, we sought to determine whether higher-dose statin therapy would b e beneficial in Japanese patients in the largest-ever trial comparing efficacy of h igh-dose vs low-dose statin therapy in patients with established stable CAD.

Statin therapy in Asian patients

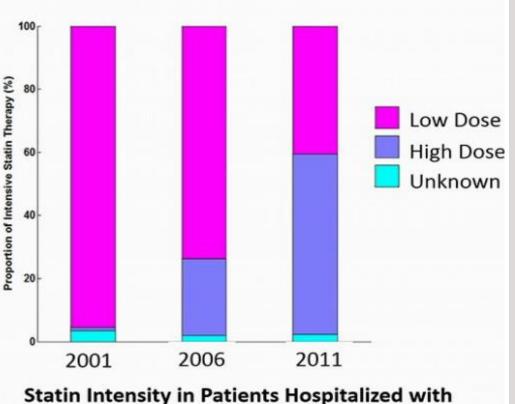

- Pharmacokinetic studies have noted <u>higher plasma levels of statins in</u> <u>patients of Asian descent</u> as compared to other ethnic groups, even when comparable doses of statins are used
- For this reason, some statin labels and some regulatory bodies suggest using lower doses of statins in Asian patients

Karol Watson, MD, PhD, FAHA, UCLA medical center

Statin therapy in asian pts

- Patients of Asian descent are often not treated with high dose statin therapy, even in clinically appropriate situations
- Demonstrating safety and efficacy of high dose statin therapy in Asian populations is therefore, of utmost importance

Acute Myocardial Infarction in China

ISSUE of STATIN

FDA warning

Published: Feb 28, 2012

By Peggy Peck , Executive Editor, MedPage Today

WASHINGTON -- The FDA said today that all statins must carry warnings about increased risks of elevated blood sugar and possible transient memory and cognition problems, but at the same time the agency removed a standing recommendation for routine liver function tests for patients taking the cholesterollowering drugs.

http://www.medpagetoday.com/Cardiology/Dyslipidemia/31408

Based on clinical trial meta-analyses and epidemiological data from the published literature, information concerning an effect of statins on incident diabetes and increases in HbA1c and/or fasting plasma glucose was added to statin labels.

The association between Higher doses of statins and new-onset Diabetes

- In a pooled analysis, intensive-dose statin therapy was associated with an increased risk of new-onset diabetes compared with moderate-dose statin therapy.
- As compared with moderate-dose statin, the number needed to harm per year for intensive-dose statin was 498 for new-onset DM while the number needed to treat per year for intensive-dose statin was 155 for CV events.

4.4 Special warnings and precautions for use¹⁾

Diabetes Mellitus

Some evidence suggests that statins as a class raise blood glucose and in some patients, at high risk of future diabetes, may produce a level of hyperglycaemia where formal diabetes care is appropriate. This risk, however, is outweighed by the reduction in vascular risk with statins and therefore should not be a reason for stopping statin treatment. Patients at risk of hyperglycaemia (fasting glucose 5.6 to 6.9 mmol/L, BMI>30 kg/m2, raised triglycerides, hypertension), should be monitored both clinically and biochemically according to national guidelines. However, there has been no confirmed signal of a diabetes risk for pitavastatin either in post-marketing safety surveillance studies or in prospective studies (see section 5.1).

MHRA가 인정한 당뇨병에 안전한 유일한 스타틴

Medicines & Healthcare products Regulatory Agency

영국식약처(MHRA), 2016년 3월 7일 리바로[®] 제품설명서(SmPC)에 당뇨병 안전성 인정 리바로만이 PMS와 임상시험 자료를 근거로 당뇨병 위험 징후가 없음을 언급

4.4 Special warnings and precautions for use

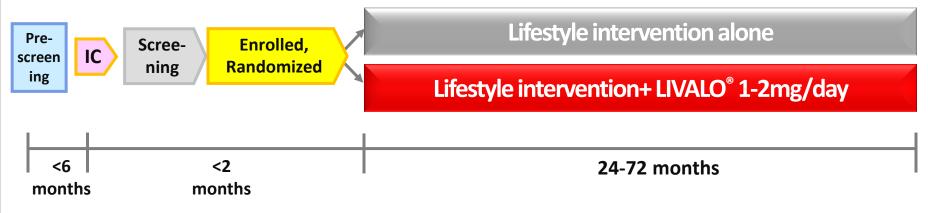

Diabetes Mellitus

Some evidence suggests that statins as a class raise blood glucose and in some patients, at high risk of future diabetes, may produce a level of hyperglycaemia where formal diabetes care is appropriate. This risk, however, is outweighed by the reduction in vascular risk with statins and therefore should not be a reason for stopping statin treatment. Patients at risk of hyperglycaemia (fasting glucose 5.6 to 6.9 mmol/L, BMI>30 kg/m2, raised triglycerides, hypertension), should be monitored both clinically and biochemically according to national guidelines. However, there has been no confirmed signal of a diabetes risk for pitavastatin either in post-marketing safety surveillance studies or in prospective studies (see section 5.1).

J-PREDICT study

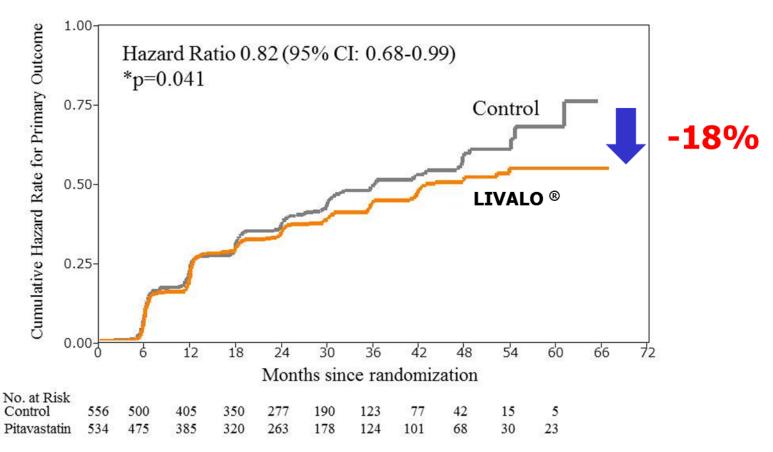

Subject	IGT
Primary outcome	Cumulative incidence of diabetes
Secondary outcome	Incidence of any cardiovascular diseases, etc
Study drug	LIVALO [®] 1-2mg/day vs. control group
Sample size	1,240
Study period	Apr. 2007 to Mar. 2013 (recruitment closure Mar. 31,2010)
Principal investigator	Takashi Kadowaki (the university of Tokyo)

Prospective, Randomized, Open - label, Blinded – Endpoint (PROBE)

J-PREDICT study

Effect of LIVALO[®] on the incidence of diabetes

*P value was calculated using a log-rank test that was stratified according to the 5 assignment factors (sex, age, Body mass index, 2-h plasma glucose, and presence of hypertension).

Title	Effect of pitavastatin on glucose, HbA1c and incident diabetes: A meta-analysis of randomized controlled clinical trials in individuals without diabetes
Methods	Until 2014 for ≥12-week follow-up placebo or statin-controlled RCT of pitavastatin that included participants without diabetes and reported on fasting blood glucose (FBG), HbA1c or NOD. -> 15 studies (approx. 1600 person-years)
Results	No significant differences associated with pitavastatin (vs. control) were observed for FBG (MD -0.01 mg/dL [95%CI -0.77, 0.74], $I^2 = 0\%$), HbA1c (MD -0.03% [95%CI - 0.11, 0.05], $I^2 = 43\%$) or NOD (RR 0.70 [95%CI 0.30, 1.61]; RD 0.0 [95%CI -0.004, 0.003]; $I^2 = 0\%$). Sensitivity and subgroup analyses (including type of control [placebo or other statin], pitavastatin dose or follow-up] did not yield significant results.

다른 스타틴과 비교해서 LIVALO[®] 은 당뇨병발생에 부정적인 영향을 미치지 않습니다.

- REAL-CAD trial adds important clinical evidence in support of <u>high dose</u> statin therapy in Asian population.
- In Asian CAD population, *pitavastatin 4mg daily* <u>reduced the composite</u> <u>primary outcomes</u> more than *pitavastatin 1mg daily* at 3 years, ARR = 1.1%, <u>RRR = 19%</u>; NNT = 63
- 3. Pitavastatin 4mg daily reduced total mortality

- at 3 years, ARR = 0.9%, <u>RRR = 27%</u>, NNT = 111

4. High dose pitavastatin is well tolerated in Asian CAD patients.

Thank you for your attention^^.
