Targeted therapy with a localised abluminal groove, low-dose sirolimus-eluting, biodegradable polymer coronary stent (TARGET All Comers): a multicentre, open-label, randomised non-inferiority trial

Alexandra Lansky, William Wijns, Bo Xu, Henning Kelbæk, Niels van Royen, Ming Zheng, Marie-angèle Morel, Paul Knaapen, Ton Slagboom, Thomas W Johnson, Georgios Vlachojannis, Karin E Arkenbout, Lene Holmvang, Luc Janssens, Andrzej Ochala, Salvatore Brugaletta, Christoph K Naber, Richard Anderson, Harald Rittger, Sergio Berti, Emanuele Barbato, Gabor G Toth, Luc Maillard, Christian Valina, Paweł Buszman, Holger Thiele, Volker Schächinger, Andreas Baumbach, for the TARGET All Comers Investigators

Summary

Background The FIREHAWK is a drug-eluting stent with a fully biodegradable sirolimus-containing polymer coating localised to recessed abluminal grooves on the stent surface. We investigated clinical outcomes with this targeted, low-dose, biodegradable polymer, sirolimus-eluting stent compared with XIENCE durable polymer, everolimus-eluting stents in an all-comers population.

Methods The TARGET All Comers study was a prospective, multicentre, open-label randomised non-inferiority trial done at 21 centres in ten European countries. Patients with symptomatic or asymptomatic coronary artery disease and objective evidence of myocardial ischaemia who qualified for percutaneous coronary intervention were randomised 1:1 to undergo implantation of a FIREHAWK or XIENCE. Randomisation was web-based, with random block allocation and stratification by centre and ST elevation myocardial infarction. Outcome assessors were masked to treatment allocation, but treating physicians and patients were not. The primary endpoint was target lesion failure at 12 months, a composite of cardiac death, target vessel myocardial infarction, or ischaemia-driven target lesion revascularisation. The control event rate for XIENCE was assumed to be 7%, the non-inferiority margin was 3.5%, and the primary analysis was in the intention-to-treat population, censoring patients who did not have either an event before 365 days or contact beyond 365 days. Late lumen loss was the primary endpoint of an angiographic substudy designed to investigate the non-inferiority of the FIREHAWK compared with the XIENCE stent. This trial is registered with ClinicalTrials.gov, number NCT02520180.

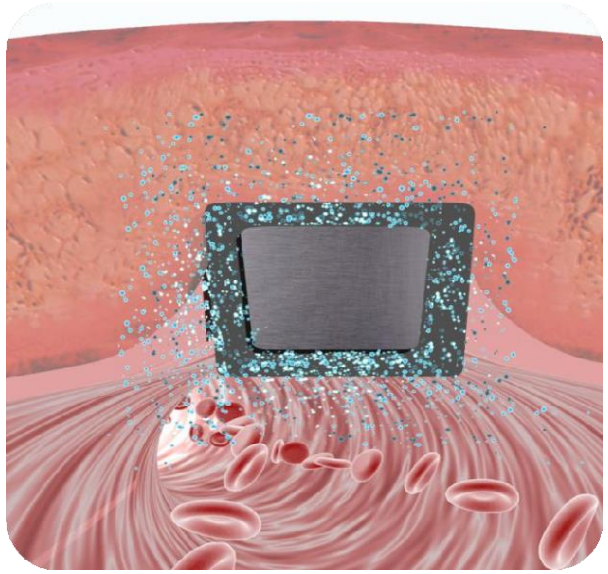
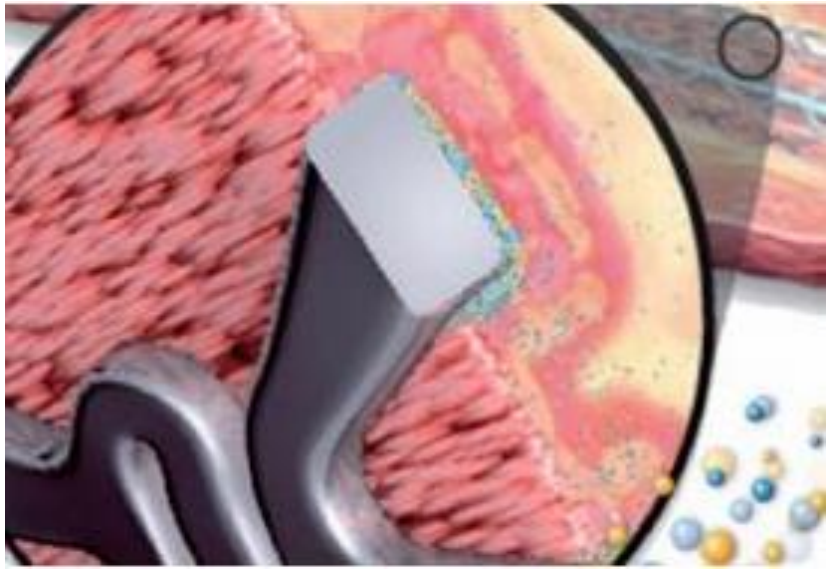
Fundamental limitations of current stents

- Drug concentration should be maximal at the abluminal side



- ✓ Multi-directional Eluting
- ✓ The drug used on DES currently inhibits both SMC and EC
- ✓ The drug not only releases to vessel, but also to the blood.



- ✓ Abluminal Eluting
- ✓ No direct antiproliferative drug on the EC side

Fundamental limitations of current stents

- …which is the most vulnerable, open site in a stent

Clinical studies using the Firehawk DES: The Target All-comer trial

Targeted therapy with a localised abluminal groove, low-dose sirolimus-eluting, biodegradable polymer coronary stent (TARGET All Comers): a multicentre, open-label, randomised non-inferiority trial

Alexandra Lansky, William Wijns, Bo Xu, Henning Kelbaek, Niels van Royen, Ming Zheng, Marie-angèle Morel, Paul Knaapen, Ton Slagboom, Thomas W Johnson, Georgios Vlachojannis, Karin E Arkenbout, Lene Holmvang, Luc Janssens, Andrzej Ochala, Salvatore Brugaletta, Christoph K Naber, Richard Anderson, Harald Rittger, Sergio Berti, Emanuele Barbato, Gabor G Toth, Luc Maillard, Christian Valina, Paweł Buszman, Holger Thiele, Volker Schächinger, Andreas Baumbach, for the TARGET All Comers Investigators

Summary

Background The FIREHAWK is a drug-eluting stent with a fully biodegradable sirolimus-containing polymer coating localised to recessed abluminal grooves on the stent surface. We investigated clinical outcomes with this targeted, low-dose, biodegradable polymer, sirolimus-eluting stent compared with XIENCE durable polymer, everolimus-eluting stents in an all-comers population.

Methods The TARGET All Comers study was a prospective, multicentre, open-label randomised non-inferiority trial done at 21 centres in ten European countries. Patients with symptomatic or asymptomatic coronary artery disease and objective evidence of myocardial ischaemia who qualified for percutaneous coronary intervention were randomised 1:1 to undergo implantation of a FIREHAWK or XIENCE. Randomisation was web-based, with random block allocation and stratification by centre and ST elevation myocardial infarction. Outcome assessors were masked to treatment allocation, but treating physicians and patients were not. The primary endpoint was target lesion failure at 12 months, a composite of cardiac death, target vessel myocardial infarction, or ischaemia-driven target lesion revascularisation. The control event rate for XIENCE was assumed to be 7%, the non-inferiority margin was 3.5%, and the primary analysis was in the intention-to-treat population, censoring patients who did not have either an event before 365 days or contact beyond 365 days. Late lumen loss was the primary endpoint of an angiographic substudy designed to investigate the non-inferiority of the FIREHAWK compared with the XIENCE stent. This trial is registered with ClinicalTrials.gov, number NCT02520180.

Findings From Dec 17, 2015, to Oct 14, 2016, 1653 patients were randomly assigned to implantation of the FIREHAWK (n=823) or XIENCE (n=830). 65 patients in the FIREHAWK group and 66 in the XIENCE group had insufficient follow-up data and were excluded from the analyses. At 12 months, target lesion failure occurred in 46 (6·1%) of 758 patients in the FIREHAWK group and in 45 (5·9%) of 764 patients in the XIENCE group (difference 0·2%, 90% CI −1·9 to 2·2, $p_{\text{non-inferiority}}$=0·004, 95% CI −2·2 to 2·6, $p_{\text{superiority}}$=0·88). There were no differences in ischaemia-driven revascularisation or stent thrombosis rates at 12 months. 176 patients were included in the angiographic substudy, in which in-stent late lumen loss was 0·17 mm (SD 0·48) in the FIREHAWK group and 0·11 mm (0·52) in the XIENCE group (p=0·48), with an absolute difference of 0·05 mm (95% CI −0·09 to 0·18, $p_{\text{non-inferiority}}$=0·024).

Interpretation In a broad all-comers population of patients requiring stent implantation for myocardial ischaemia, the FIREHAWK was non-inferior to the XIENCE as assessed with the primary endpoint of target lesion failure at 12 months and in-stent late lumen loss at 13 months. The FIREHAWK is a safe and effective alternative stent to treat patients with ischaemic coronary artery disease in clinical practice.

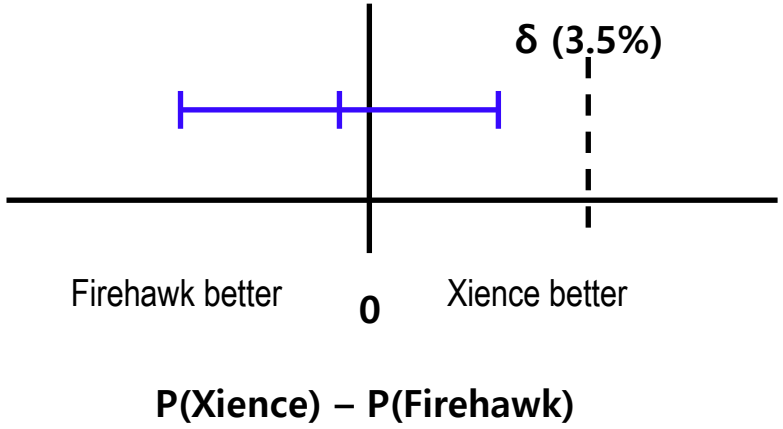
The Target All-comer trial

- Statistical Assumptions

- **A total of 1654 randomized subjects (1572 evaluable) will provide 85% power to demonstrate non inferiority based on the following assumptions:**

  - 1:1 Randomization
  - **Primary Endpoint TLF Control event rate: 7%**
  - Non Inferiority Margin: 3.5% (50% relative)
  - One sided alpha: 0.05
  - Loss to follow-up: 5%
  - Intention-to-treat population



Lancet. 2018 Sep 29;392(10153):1117-1126.

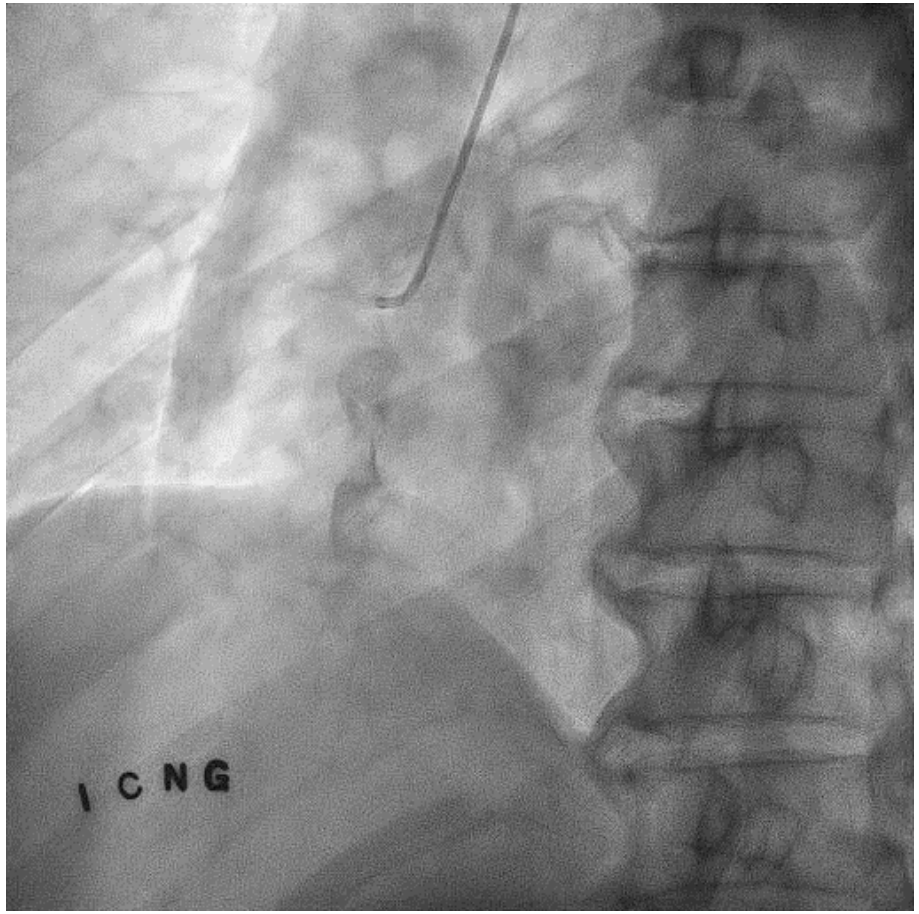
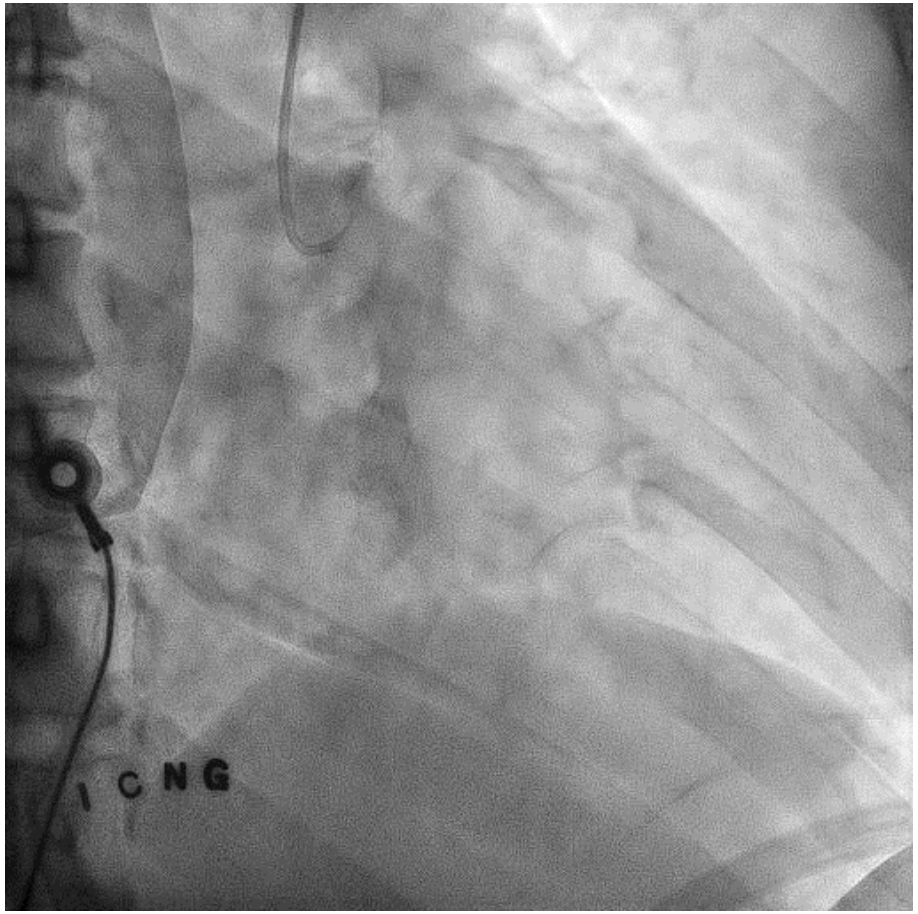
LCx: os focal 80% stenosis, pLCx near total occlusion

Case Presentation: Initial CAG



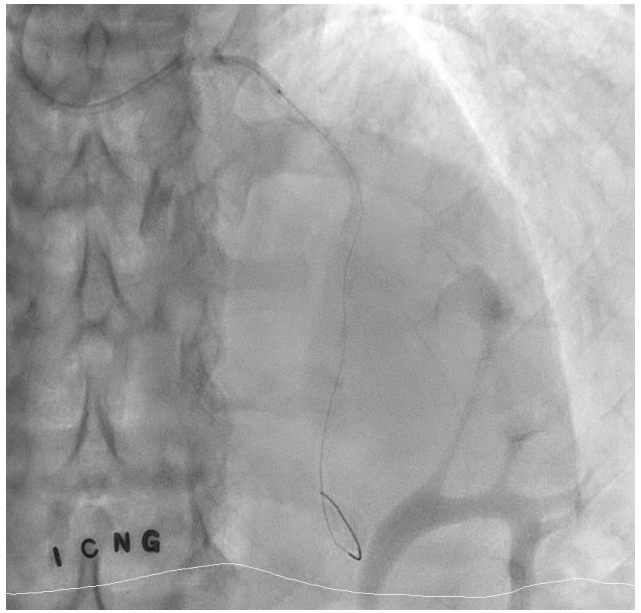


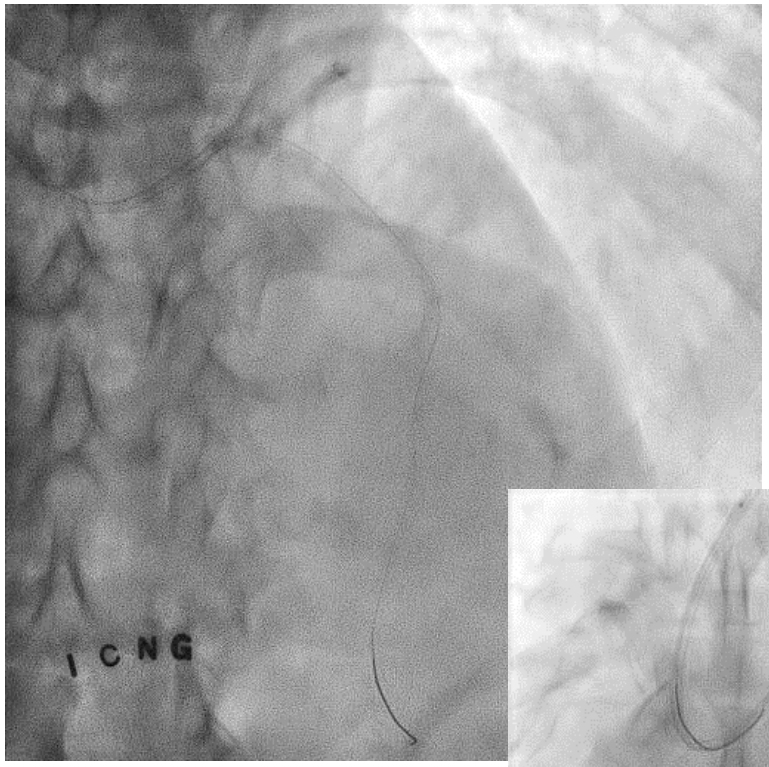
Which is the culprit?

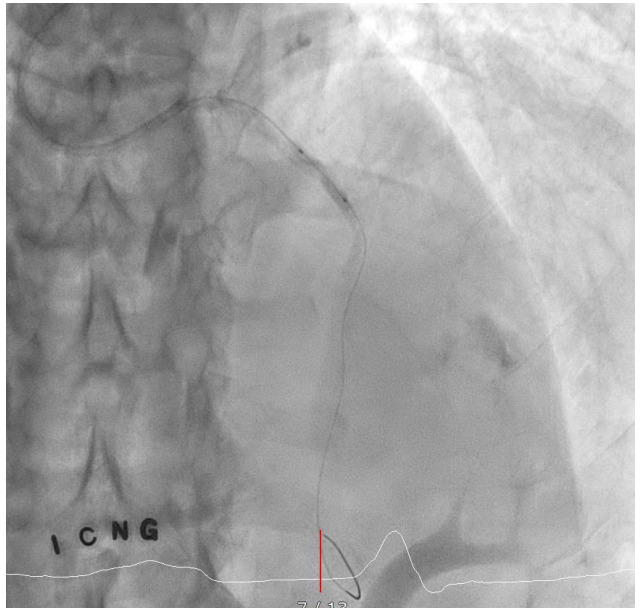
One stage PCI? Or two staged?

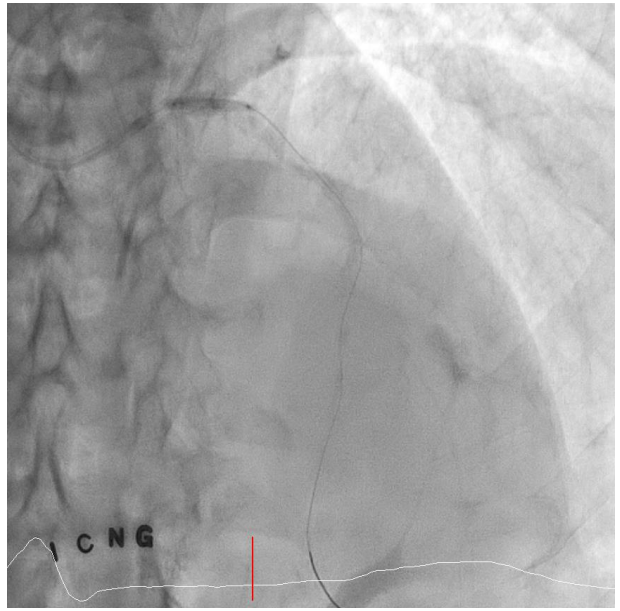
RCA: pRCA focal 20% stenosis
mRCA diffuse upto 50% stenosis

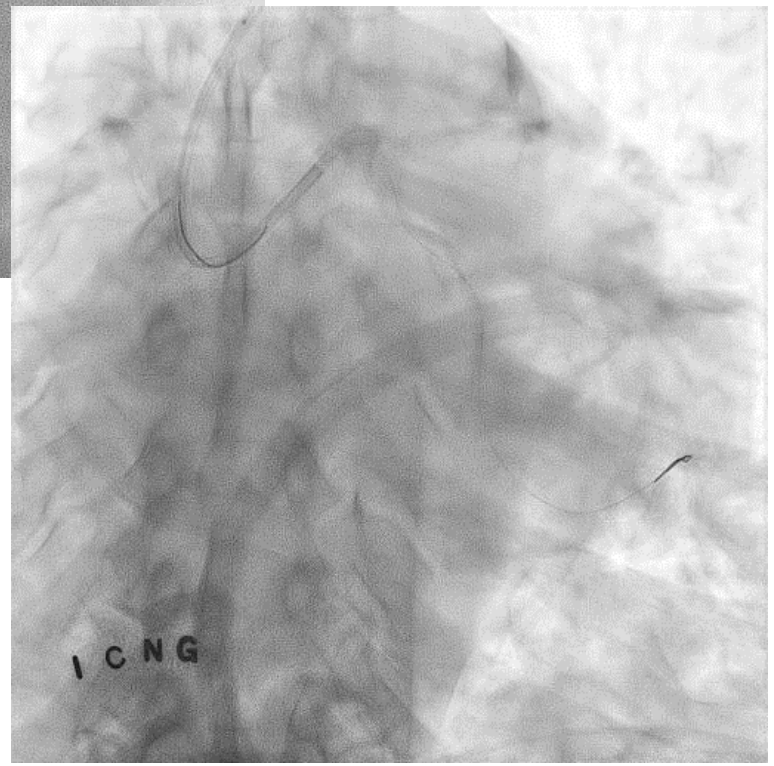
Case Presentation: PCI #1



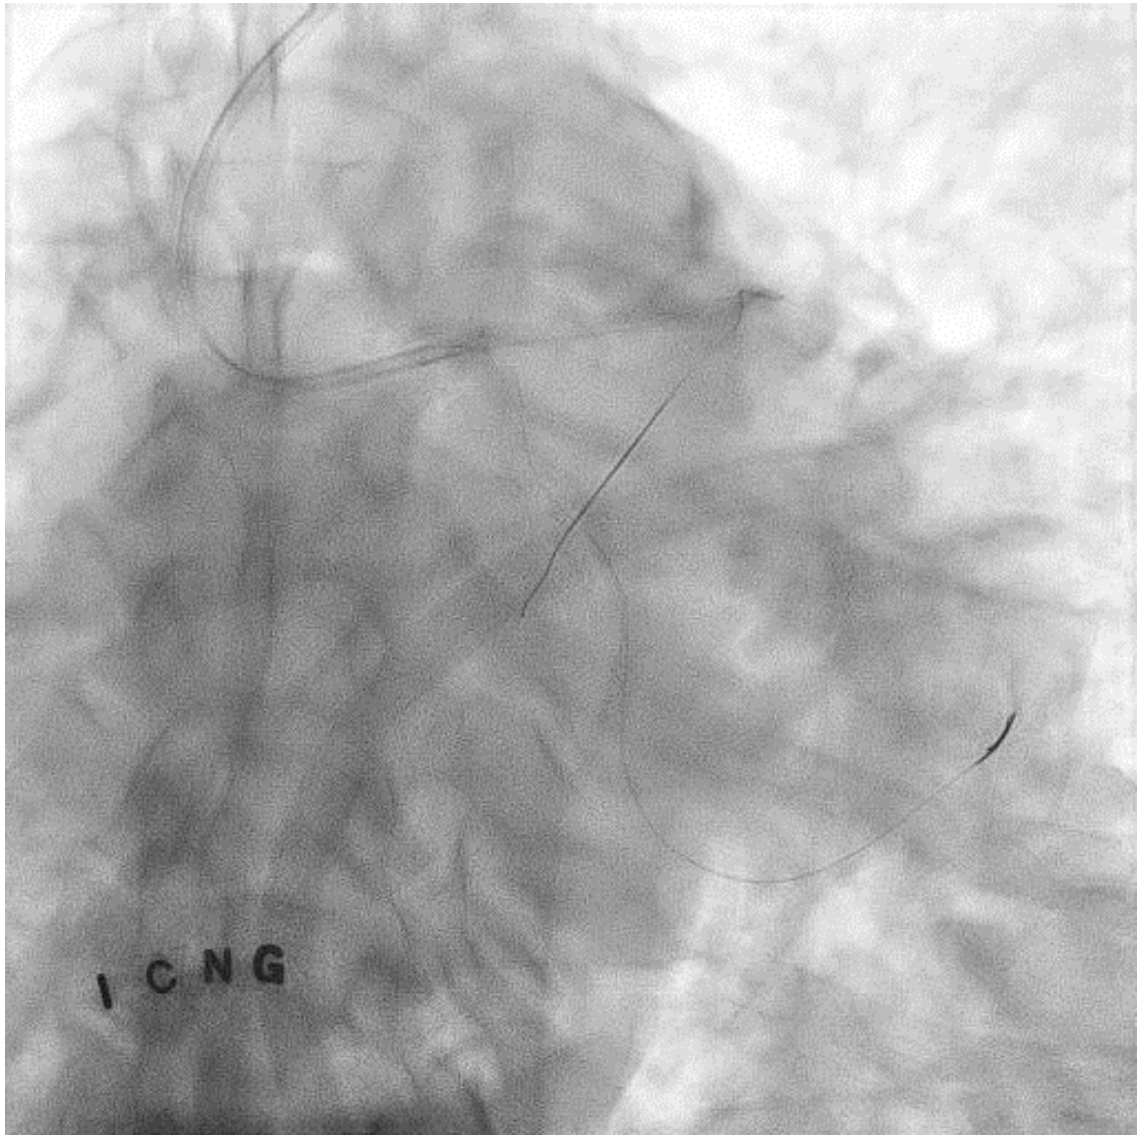








Case Presentation: PCI #1..and proceed?

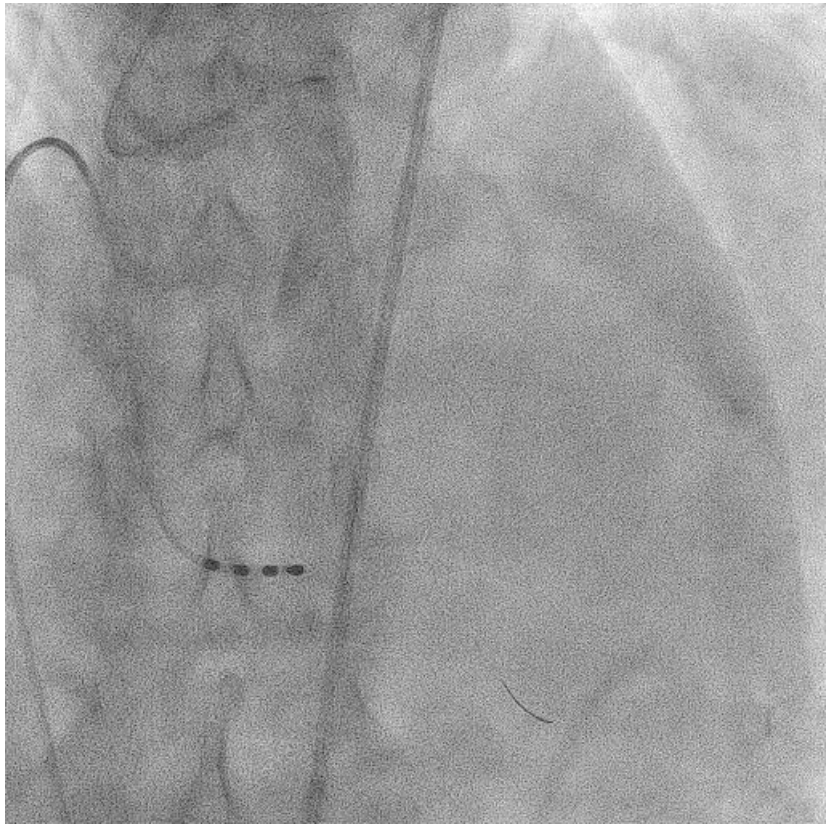


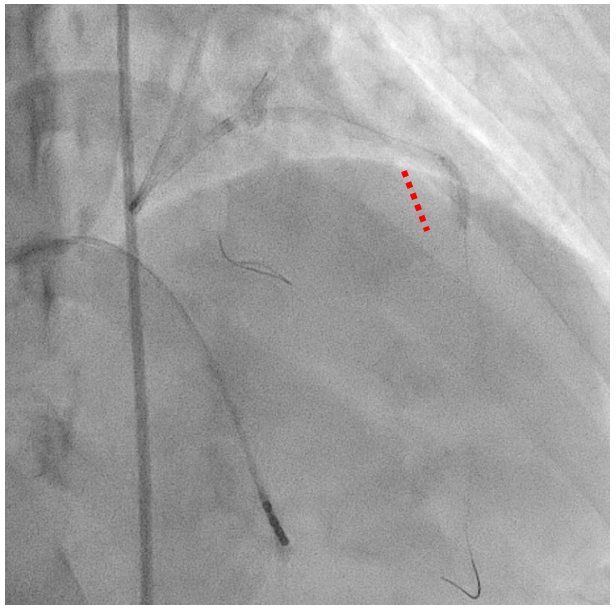
PCI for the LCX lesion without difficulty
(Resolute Onyx 2.75mm x 30mm)

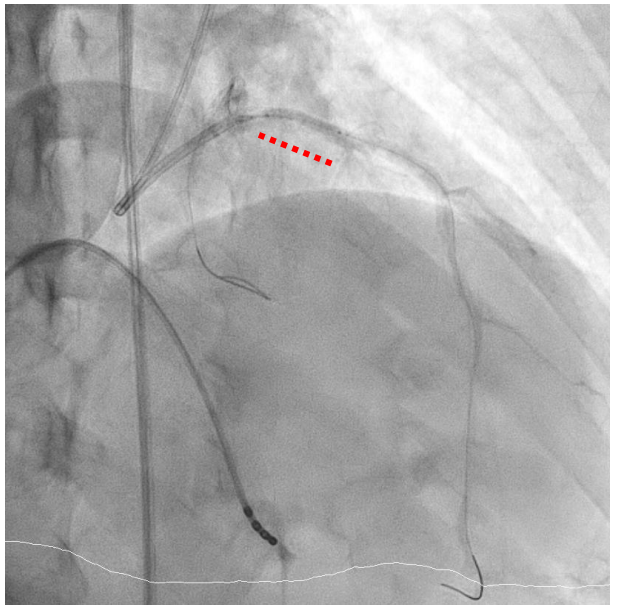
Vital sign stable

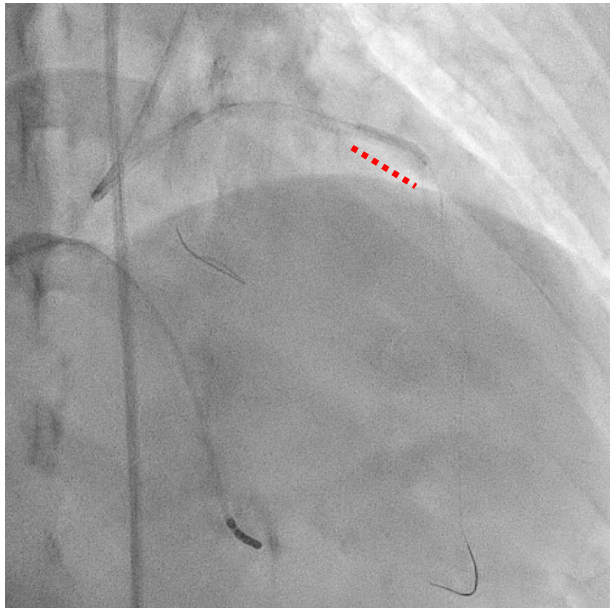
LAD PCI may need….
Rota-ablation needed
which is not appropriate on Friday night?

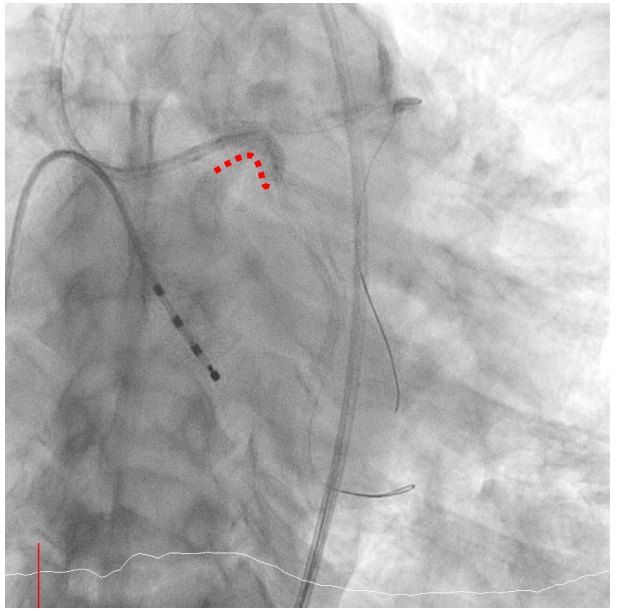
Case Presentation: PCI #2





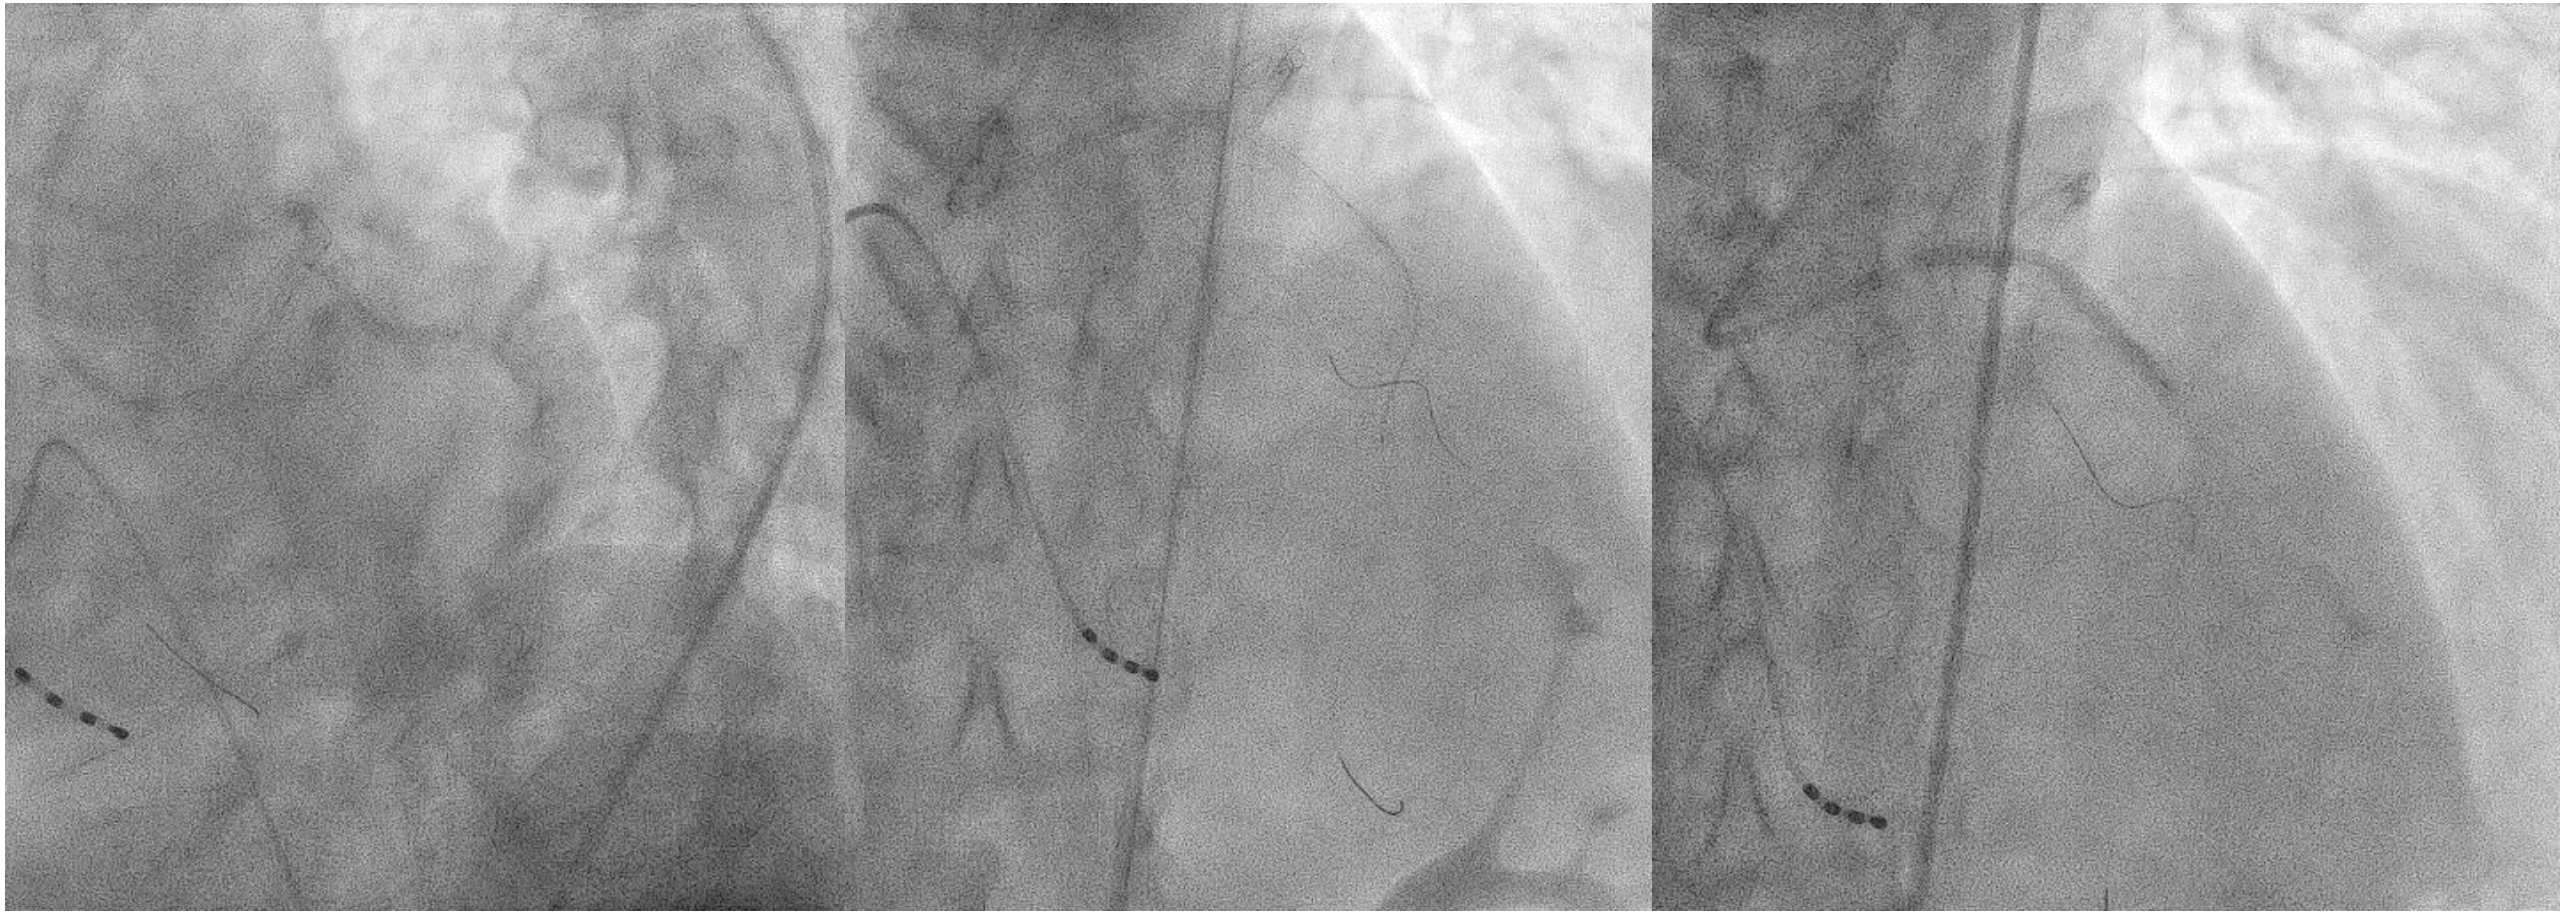






Rota-ablation with 1.5 burr
Successful ballooning to LM-pLAD

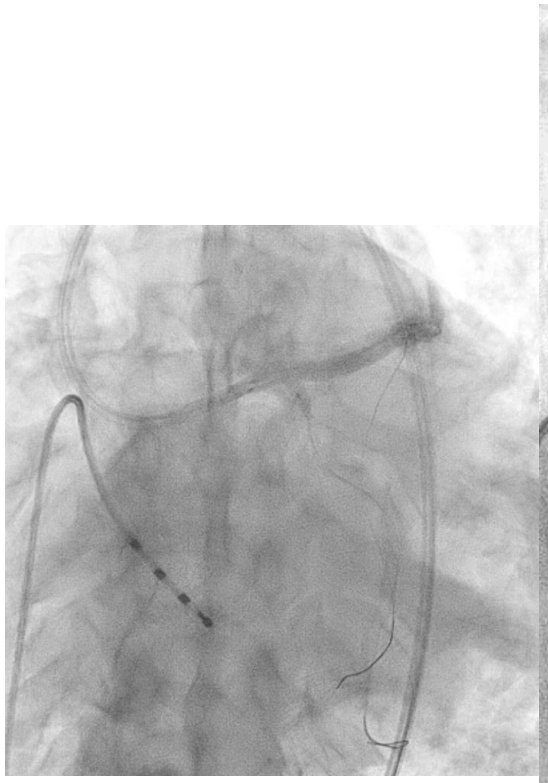
Case Presentation: PCI #2

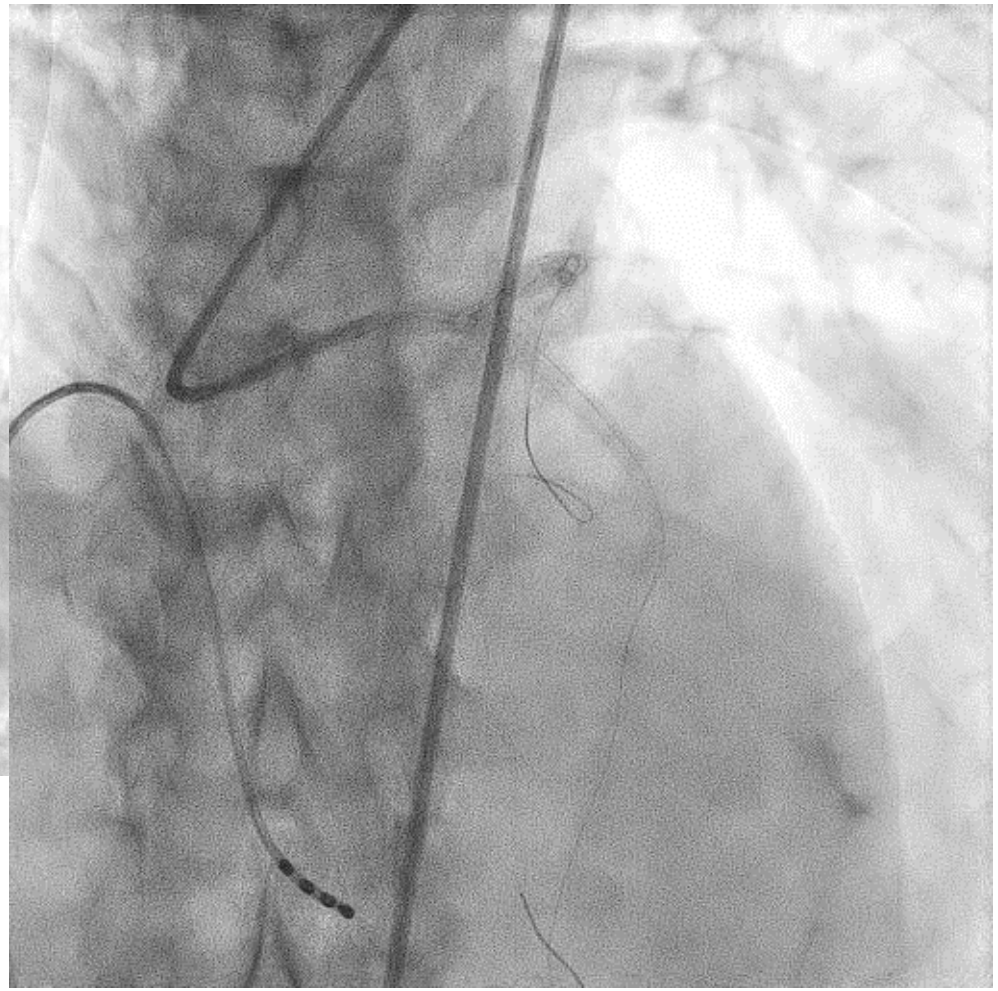


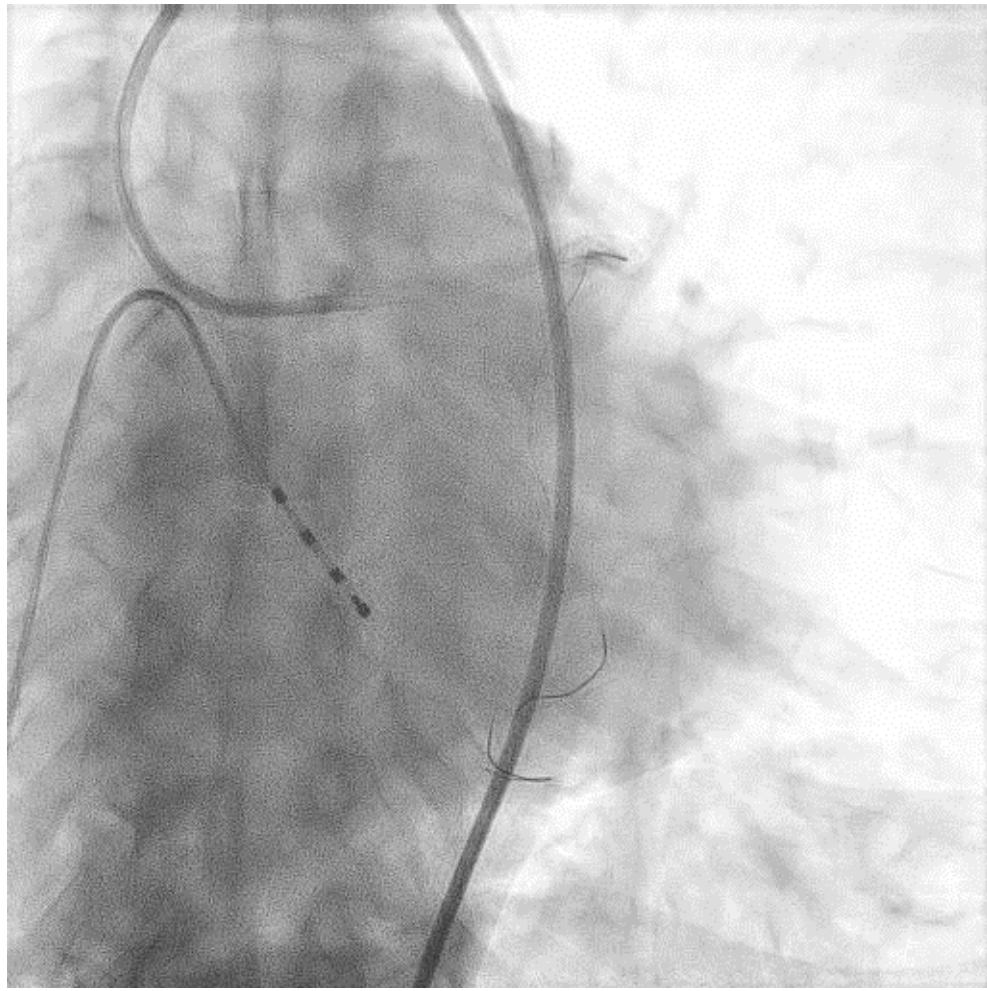
Minicrush stenting: pLCX: Firehawk 3.0mm x 23mm

LM-pLAD: Firehawk 3.5mm x 38mm, Firehawk 3.0mm x 38mm

Case Presentation: PCI #2







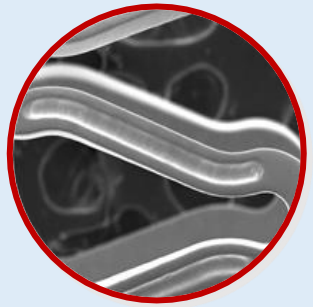
Final results after, kissing balloon to LM-LAD / LCX

Case Presentation

- EchoCG
  - Dilated LV (LVEDD 59mm) with depressed LVEF (33%)
  - RWMA: LAD/LCX territory akinesia

- Discharged 2 days after the 2nd PCI, free from cardiac symptoms

- Medication >
  - Aspirin+Plavix, Rosuvastatin 20mg, Bisoprolol 1.25mg, Valsartan 49mg 0.5T qd, Isoket 40mg bid



Successful PCI for a heavily calcified coronary artery using the localized abluminal groove Sirolimus-eluting DES
