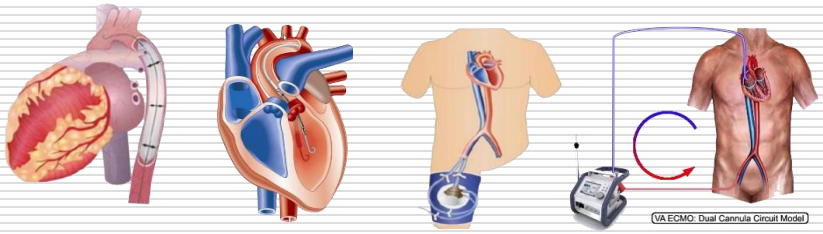
Hemodynamic Support for CHIP

CHIP: Updated Insight

Tae-Hyun Yang

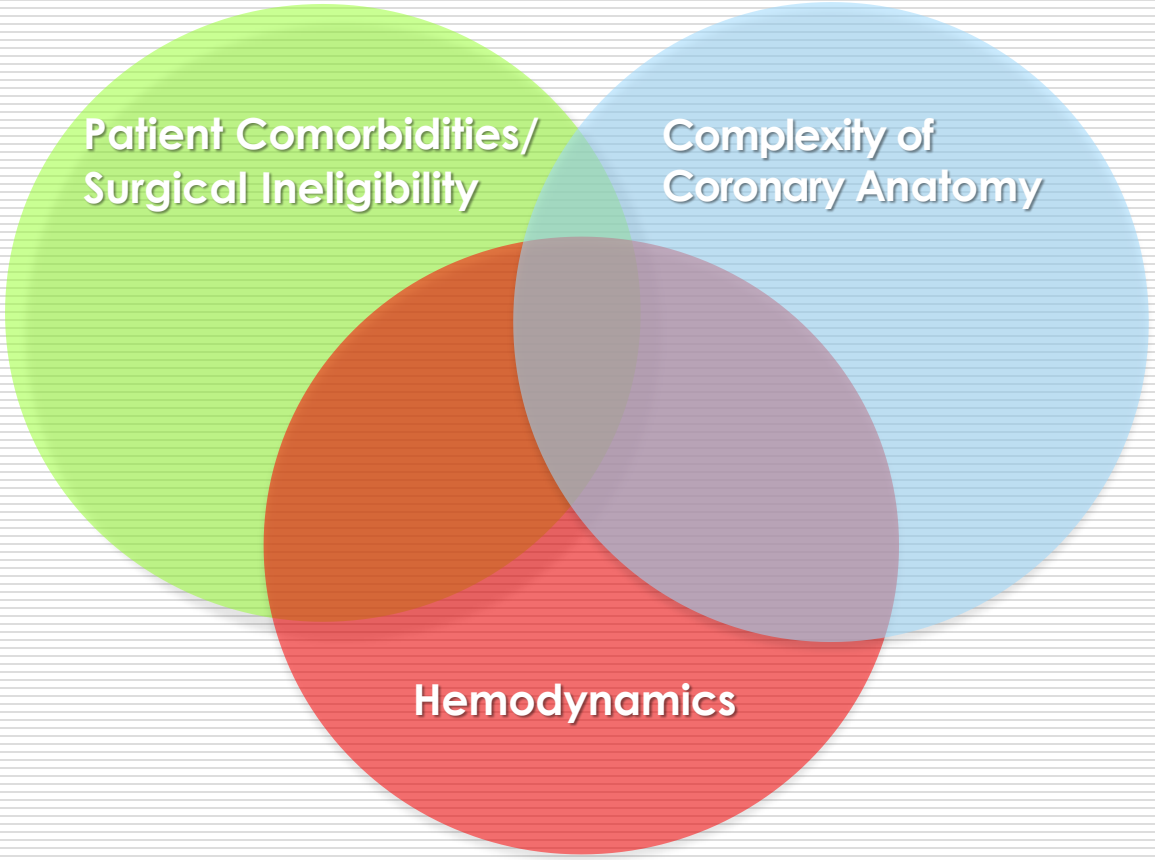
Professor of Medicine/Cardiology

Inje University Busan Paik Hospital



CHIP (Complex, Higher-risk, and Indicated Patients)

1. Acute Coronary Syndrome
2. Prior CABG
3. Heart failure
4. Atrial fibrillation
5. Advanced age
6. Diabetes
7. Renal failure
8. COPD
9. Peripheral vascular disease

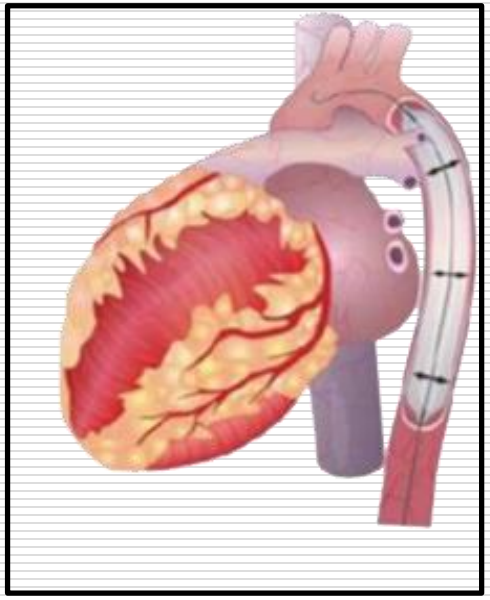


1. CTO
2. Bifurcation
3. Left Main
4. SVG
5. Thrombus
6. Calcification
7. Ostial lesions
8. Multi-vessel disease
9. Small vessel
10. Diffuse disease

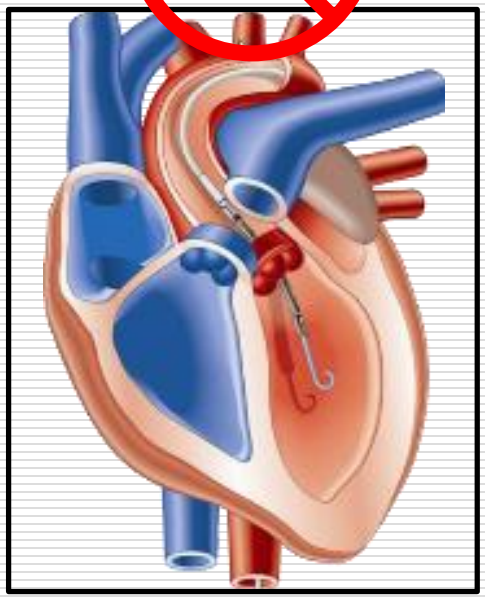
1. Low ejection fraction
2. High filling pressures

LV Percutaneous Hemodynamic Support Devices

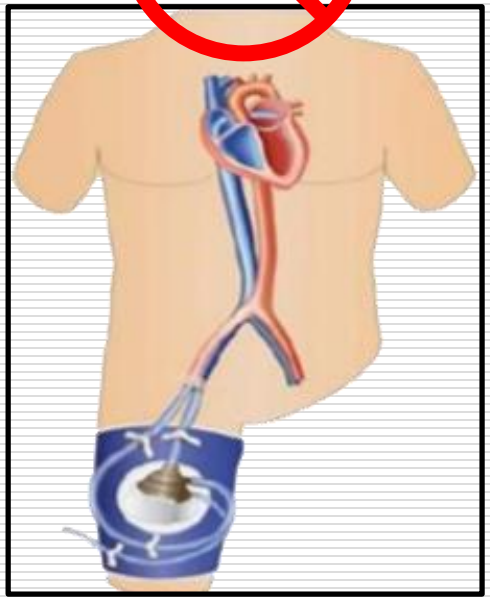
IAPB



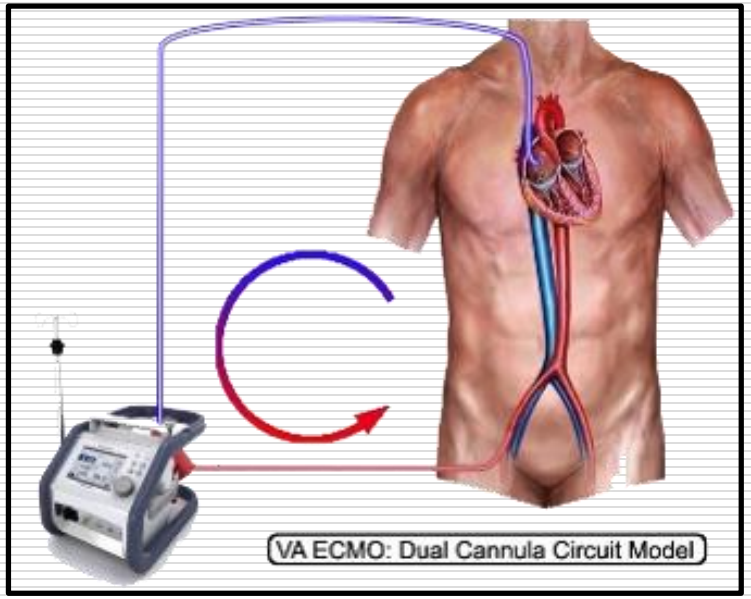
Impella



Tandem Heart



VA ECMO



Curr Treat Options Cardio Med 2016;18:6-19

Comparison of MCS Devices

	IABP	IMPELLA	TANDEMHEART	VA-ECMO
Cardiac Flow	0.3-0.5 L/ min	1-5L/ min (Impella 2.5, Impella CP, Impella 5)	2.5-5 L/ min	3-7 L-min
Mechanism	Aorta	LV → AO	LA → AO	RA → AO
Maximum implant days	Weeks	7 days	14 days	Weeks
Sheath size	7-8 Fr	13-14 Fr Impella 5.0 - 21 Fr	15-17 Fr Arterial 21 Fr Venous	14-16 Fr Arterial 18-21 Fr Venous
Femoral Artery Size	>4 mm	Impella 2.5 & CP - 5-5.5 mm Impella 5 - 8 mm	8 mm	8 mm
Cardiac synchrony or stable rhythm	Yes	No	No	No
Afterload	↓	↓	↑	↑↑↑
MAP	↑	↑↑	↑↑	↑↑
Cardiac Flow	↑	↑↑	↑↑	↑↑
Cardiac Power	↑	↑↑	↑↑	↑↑
LVEDP	↓	↓↓	↓↓	↔
PCWP	↓	↓↓	↓↓	↔
LV Preload	---	↓↓	↓↓	↓
Coronary Perfusion	↑	↑	---	---
Myocardial oxygen demand	↓	↓↓	↔↓	↔

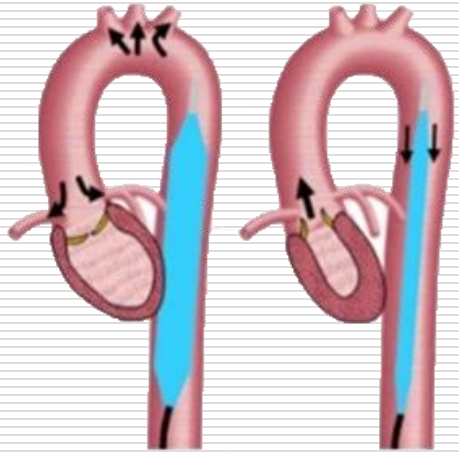
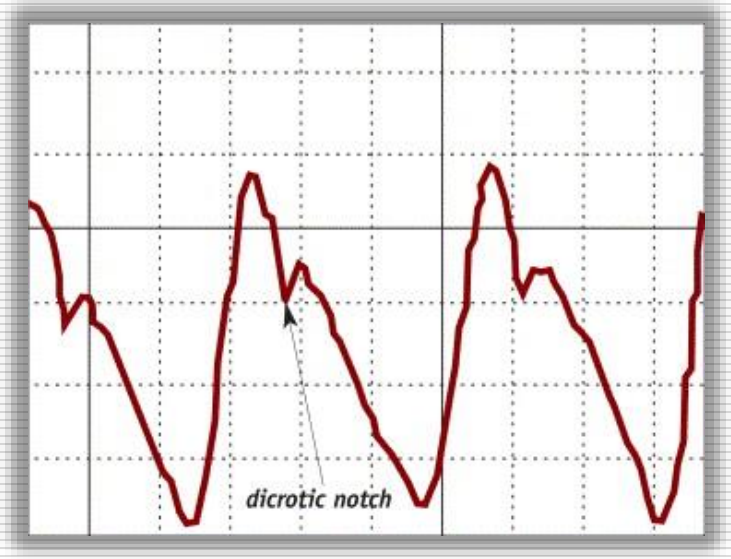
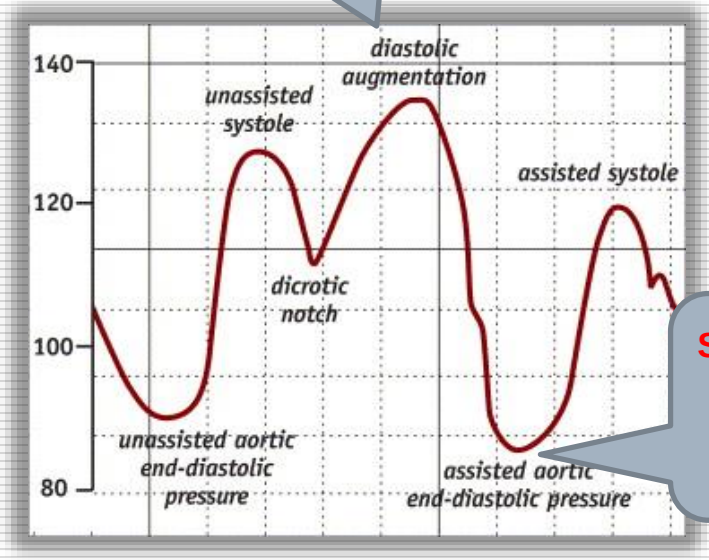
IAPB





Diastolic augmentation which augments coronary and cerebral perfusion



Systolic unloading which reduces LV afterload and augments LV SV

- **Available at nearly all PCI sites**
- **Relatively easy to be inserted (even at bedside)**
- **Most effective in early stages of shock**
- **Counterpulsation needs pulsation**

Intraaortic Balloon Support for Myocardial Infarction with Cardiogenic Shock (IAPB-SHOCK 2 Trial)

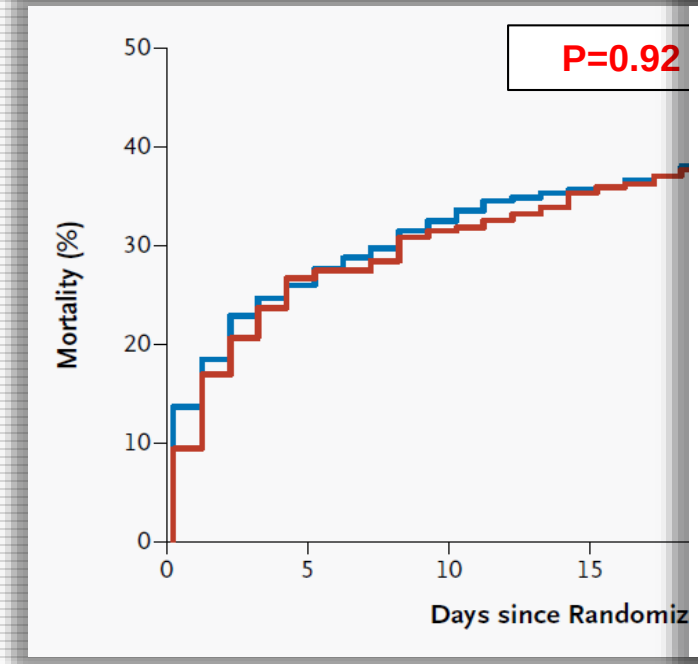
600 Patients with cardiogenic shock complication acute MI.
All patients were expected to undergo early revascularization

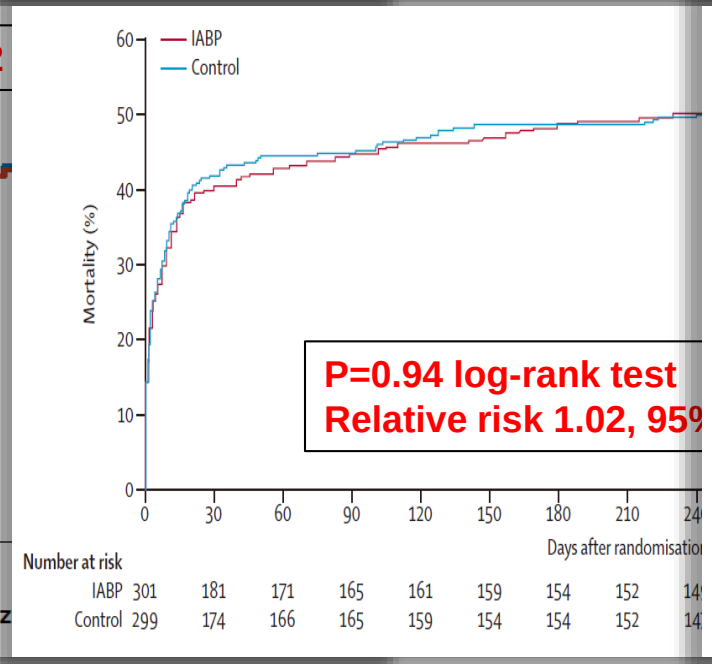
1 → IAPB, n= 301 (300)

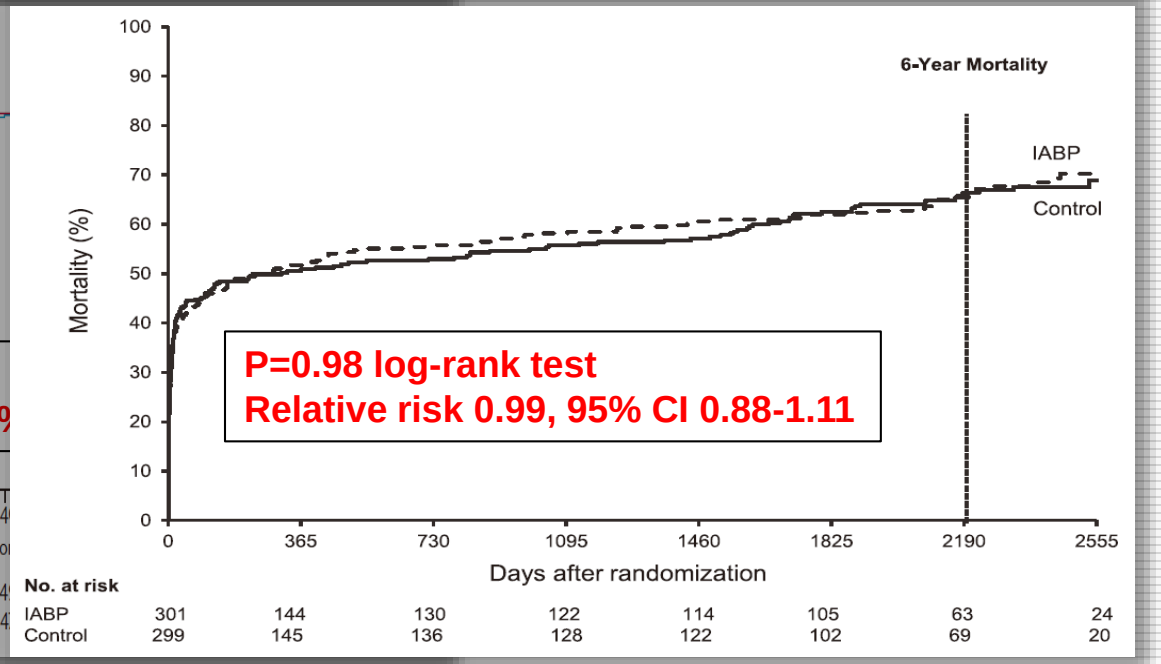
1 → Control, n=299 (298)

- Primary efficacy endpoint : 30-day all-cause mortality
- Safety assessment: major bleeding, peripheral ischemic complications, sepsis, and stroke

Primary efficacy endpoint (30-day a | **12-month all-cause m** | **6-year all-cause mortality**







New Engl J Med 2012;367:1287-1296, Lancet 2013; 382:1638-1645, Circulation 2019;139:395-403.

Meta-Analysis on the Risk of In-hospital Mortality Between IABP vs. Medical Therapy in AMICS

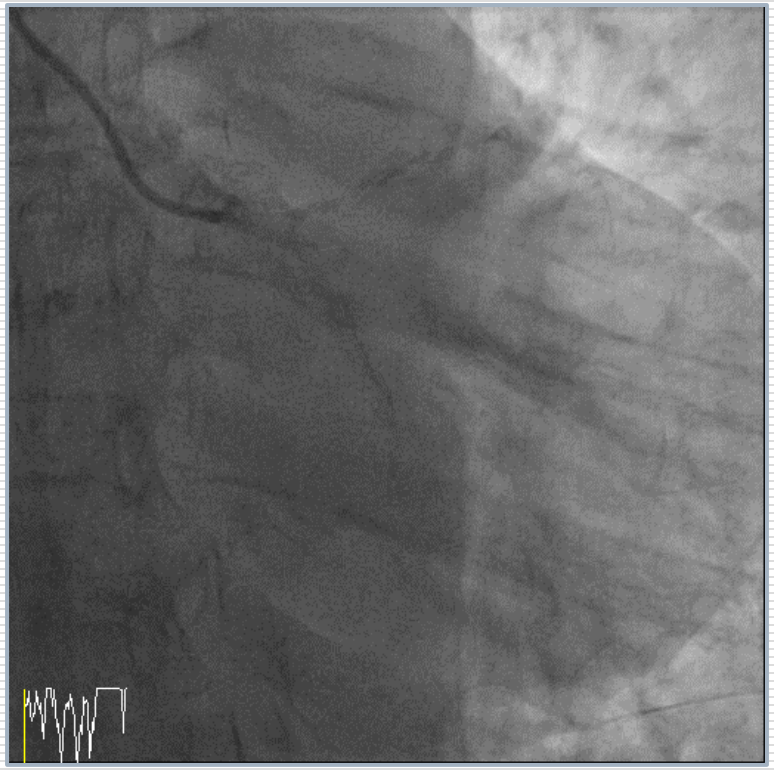
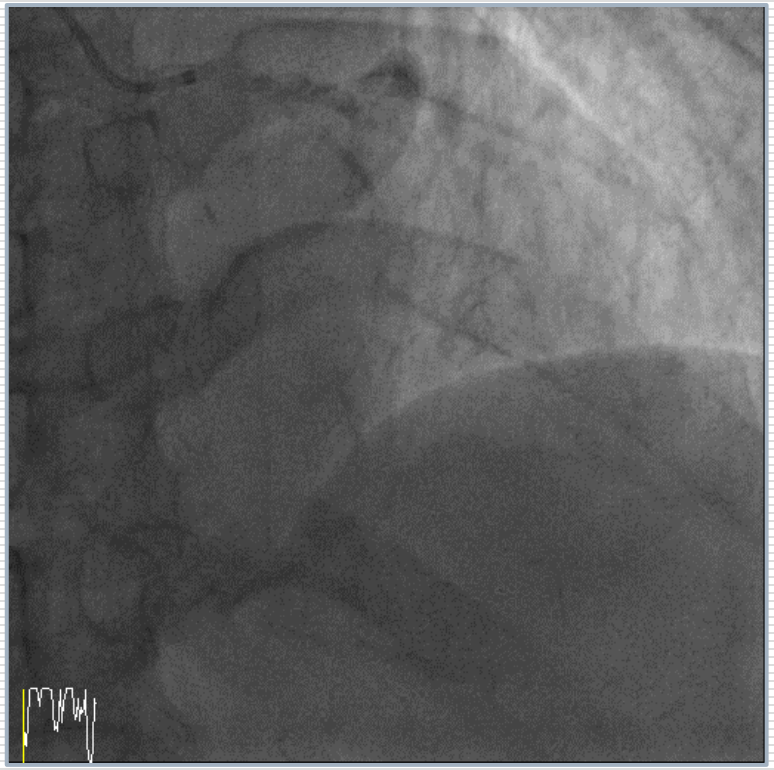
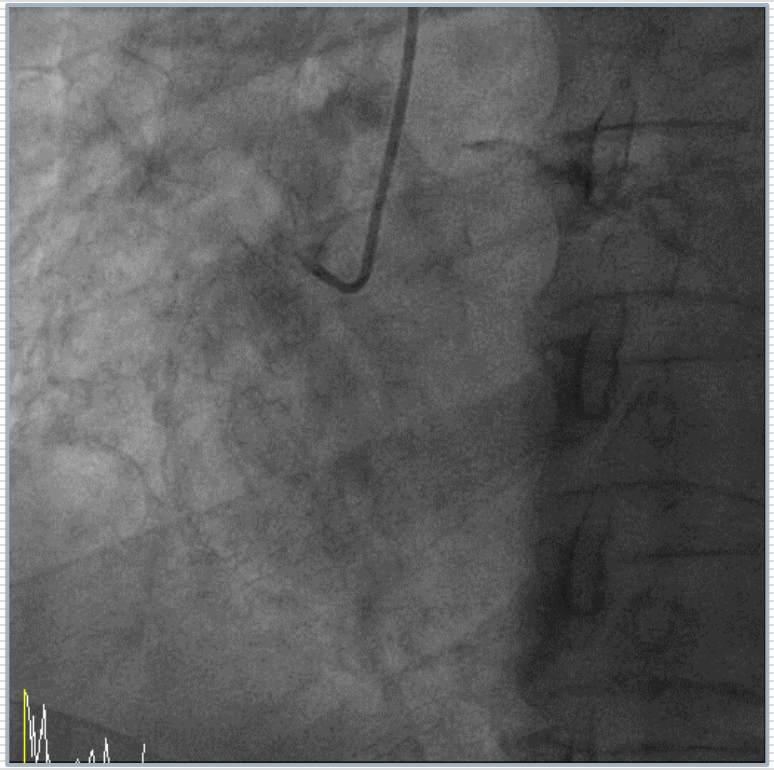
Case: 81-Year-Old Female

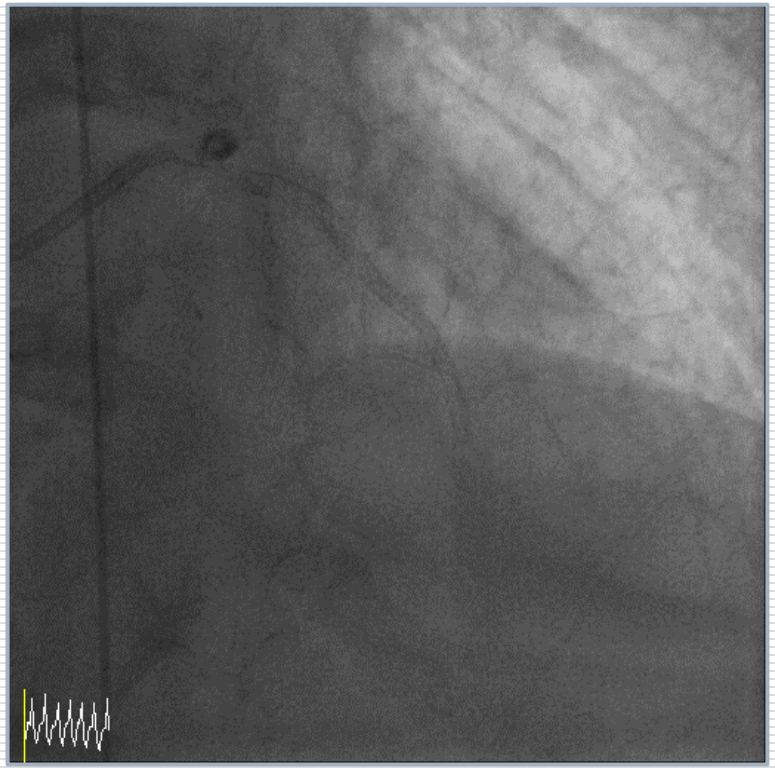


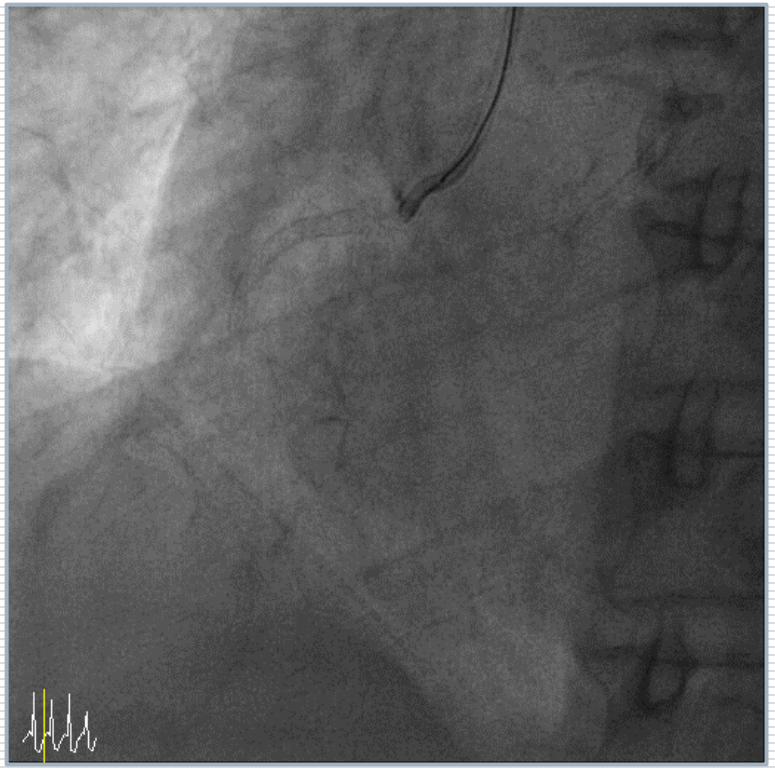




- BP: 110/60 mmHg, HR: 75 bpm
- Unstable angina
- LVEF = 29%
- 3-vessel CAD with unprotected LM disease
- Severe calcification
- Concomitant CTO

Case: 81-Year-Old Female: Elective IABP and PCI





- Elective IABP support
- Trans-radial 6F
- Child-mother technique (Heartfail)
- Buddy-wire cutting

Elective Intra-aortic Balloon Support During High-Risk Percutaneous Coronary Intervention (BCIS-1 Trial)

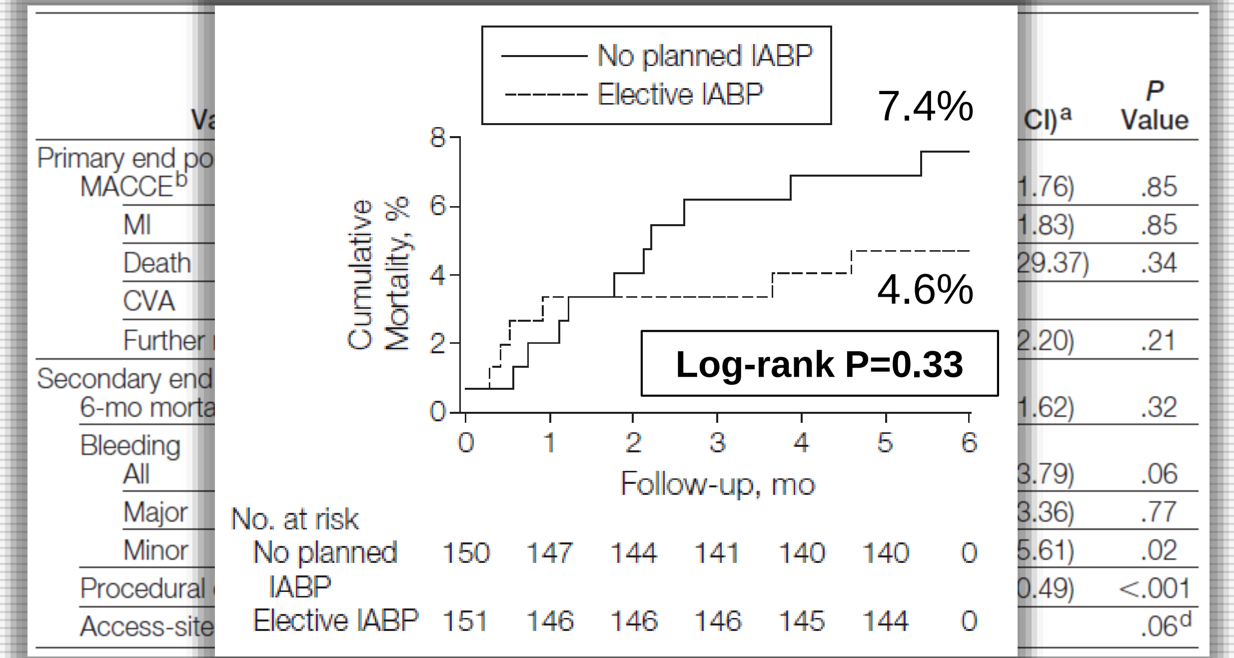
301 Patients with severe LV systolic function (LVEF ≤30%) and extensive coronary disease (Jeopardy score ≥8/12)
28% LM disease

1 Elective IAPB, n= 151

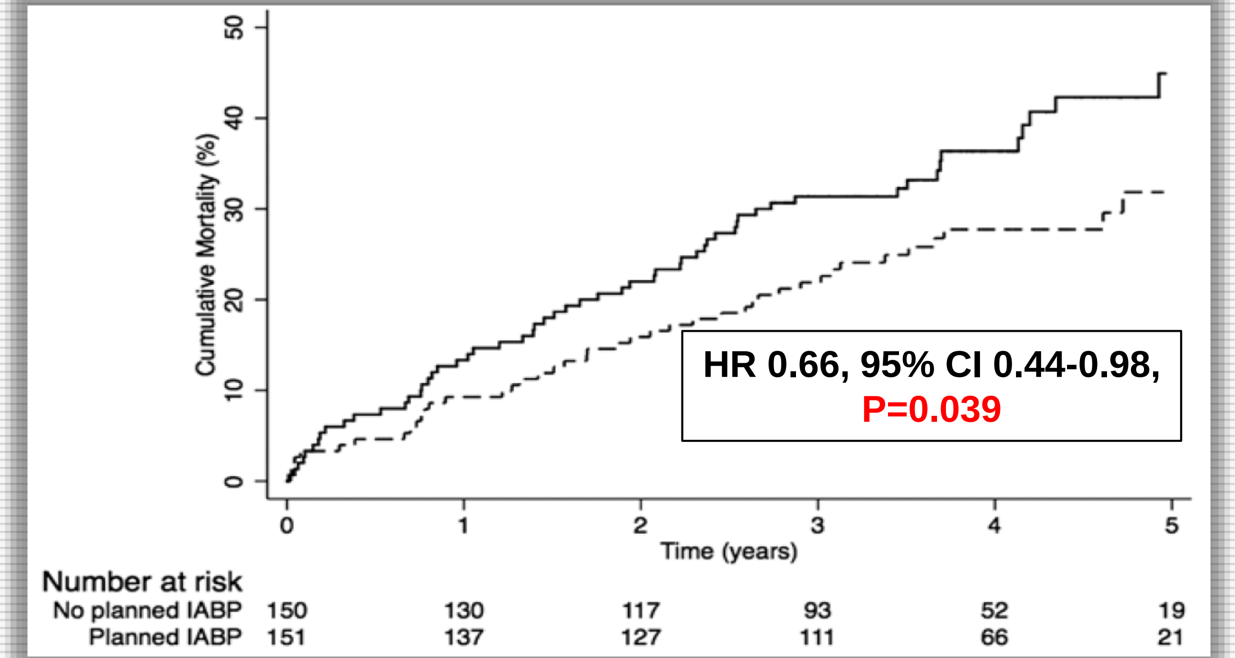
1 No planned IABP, n=150

- Primary endpoint : death, AMI, CV event, or further revascularization at hospital discharge
- Secondary endpoint: 6 month all-cause mortality, major procedural complications

Endpoints

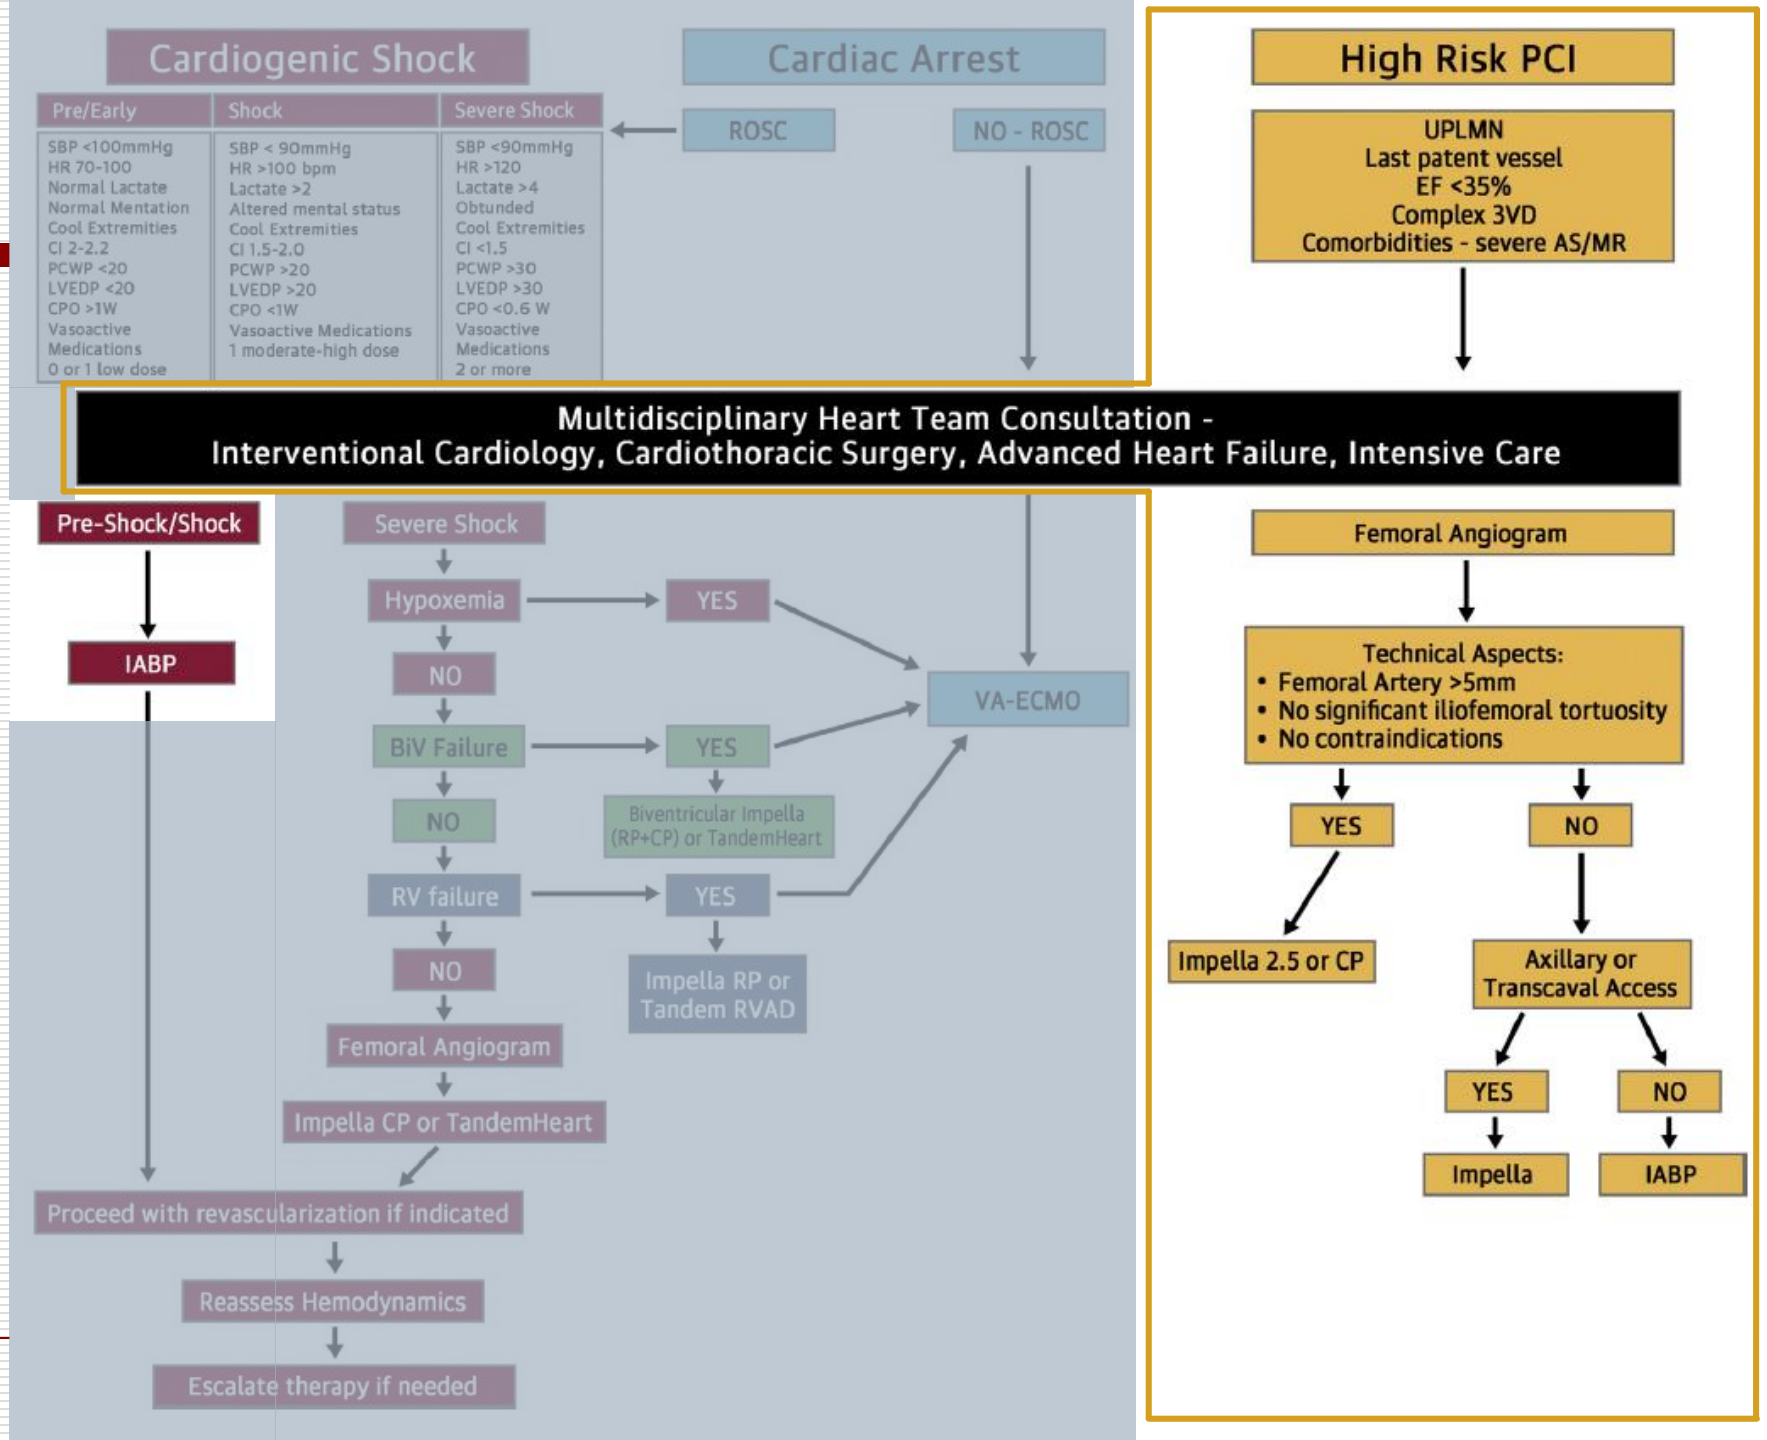


Long-term (median FU 51 months) all-cause mortality



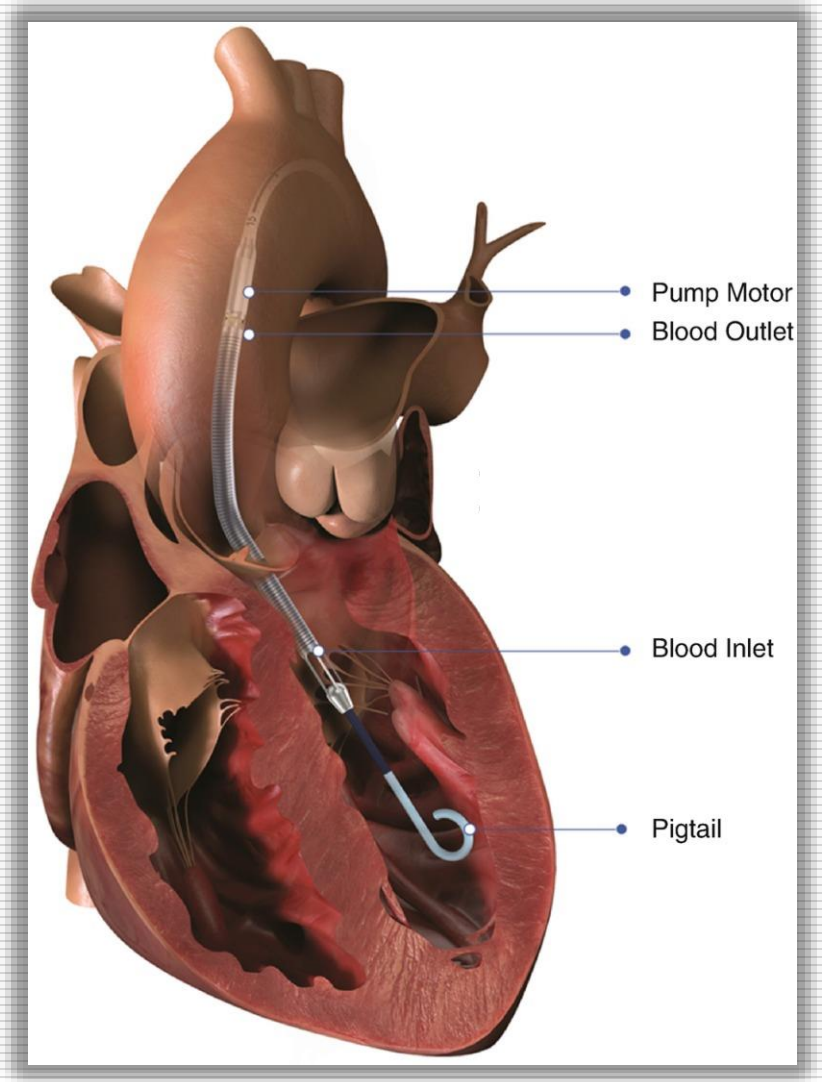
JAMA 2010;304:867-874, Circulatin 2013;127:207-212.

In Whom and When?



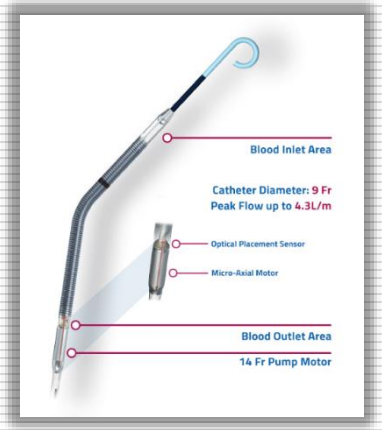
J Am Coll Cardiol Intv 2016;9:871-883

Impella



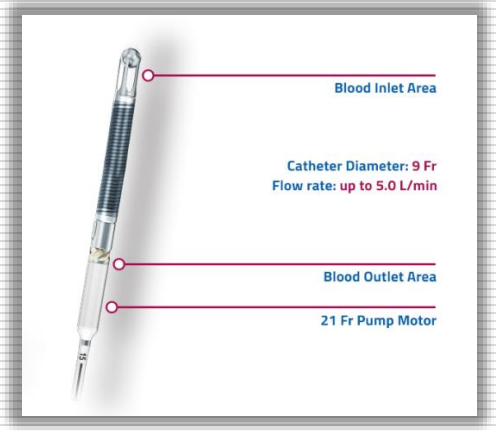
- Catheter-mounted axial flow pump
- Continuously displaces blood from the LV to the ascending aorta
- Increased cardiac index, ventricular unloading, decreased myocardial oxygen consumption, increased coronary perfusion, increased end organ perfusion
- Independent of heart rate or native cardiac function

Impella 2.5®



Impella CP®/ SmartAssist®

Impella 5.0®



Impella LD®

Impella 2.5 Provides A Better Hemodynamic Support Than IABP in AMI Cardiogenic Shock (ISAR-SHOCK)

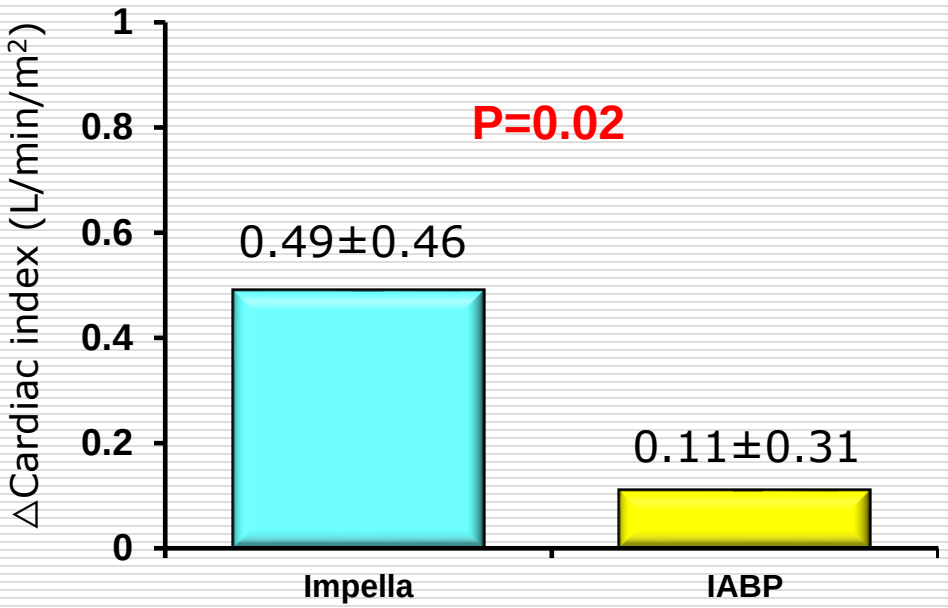
25 Patients with cardiogenic shock caused by myocardial infarction

1 → Impella LP 2.5®, n= 13

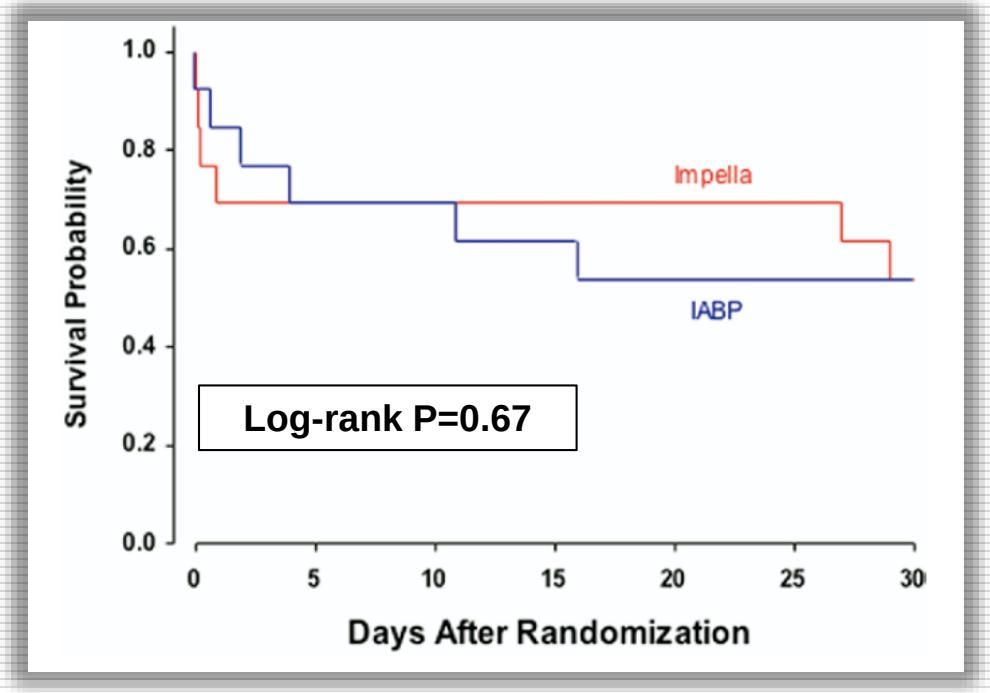
1 → IABP, n=12

- Primary endpoint : change of the cardiac index from baseline to 30 min after implantation
- Secondary endpoints: lactic acidosis, hemolysis, and mortality after 30 days

Primary endpoint



Mortality after 30 days



J Am Coll Cardiol 2008;52:1584-1588

No Mortality Benefit with Impella CP in Comparison with IABP in AMI Cardiogenic Shock (Impress Trial)

48 Patients with **severe CS** (SBP <90 mmHg or need for inotropic/vasoactive medication and requirement for mechanical ventilation) complicating **AMI**

1 → **Impella CP®, n= 24**

1 → **IABP, n=24**

- Primary endpoint : 30-day all-cause mortality
- Secondary endpoint: 6-month all-cause mortality

Mortality

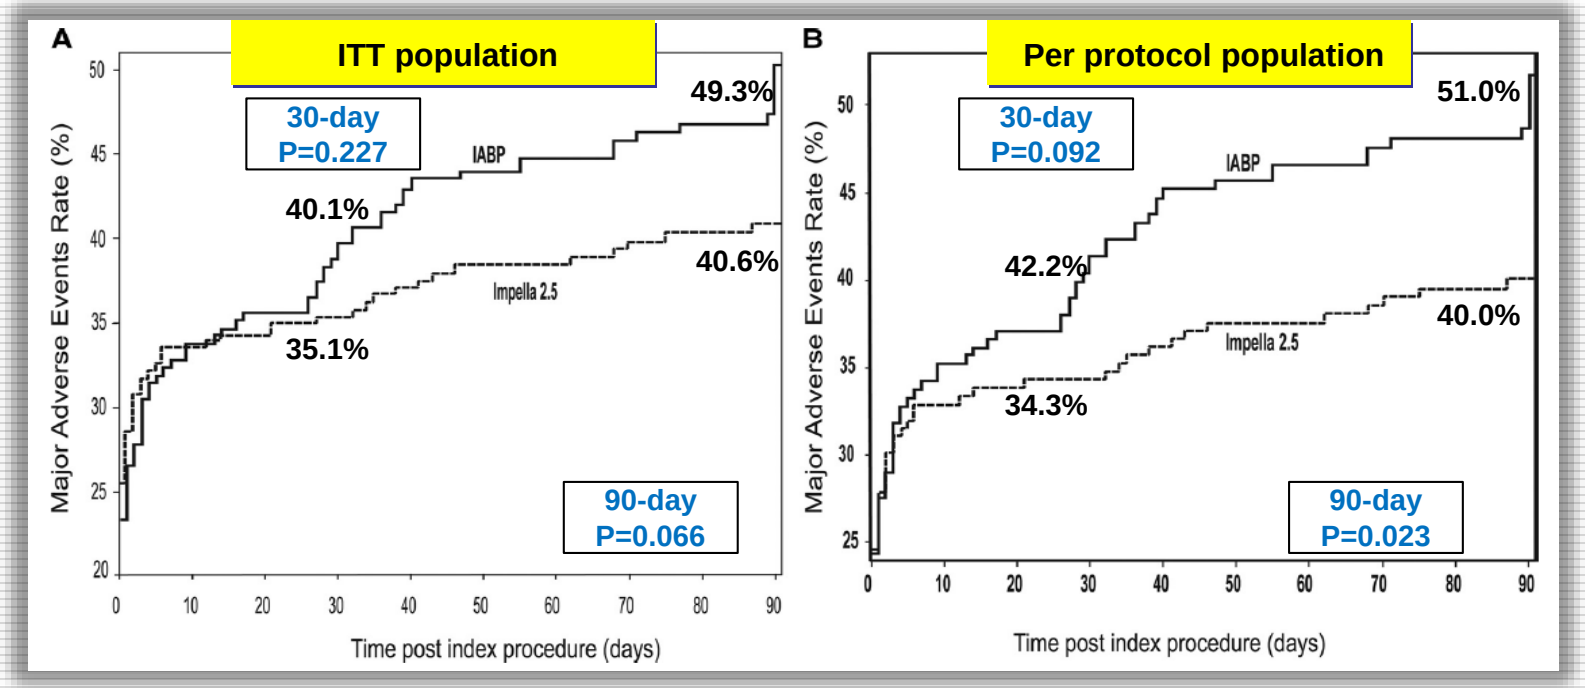
Elective Impella 2.5 vs. IAPB in Patients Undergoing High-Risk Coronary Intervention (PROTECT II Study)

452 Patients with complex 3-vessel disease or unprotected LM disease and severely depressed LV function (LVEF ≤30% or 35%)

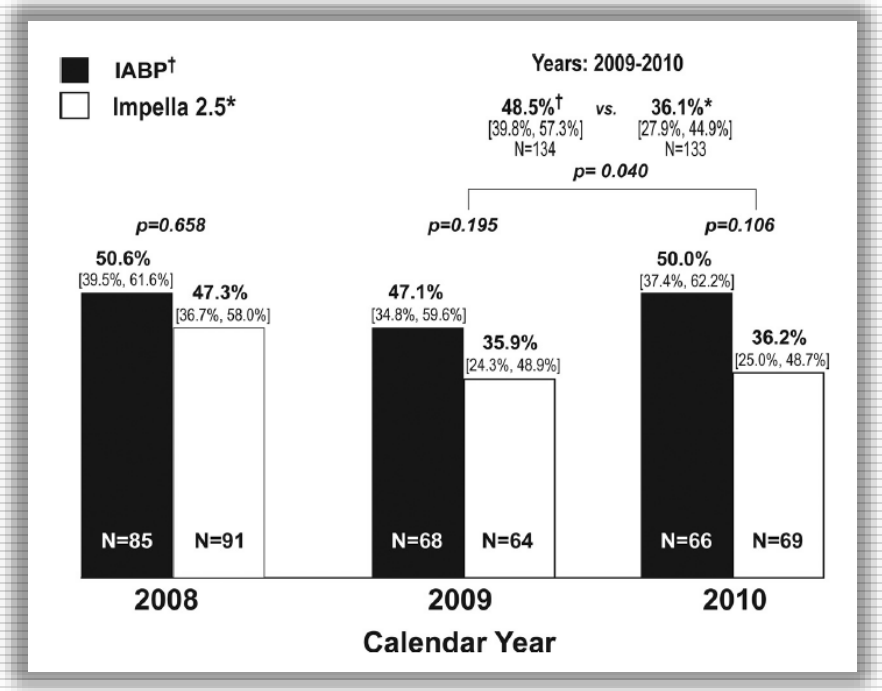
1. Elective Impella 2.5® during non emergent high risk PCI, n= 226
1. Elective IABP during non emergent high risk PCI, n=226

- Primary endpoint : 30-day MACE (death, AMI, stroke or TIA, any repeat revasc., cardiac or vascular op, AKI, severe intraprocedural hypotension, CPR, cardioversion for VT, AR, angiographic failure of PCI)

MACE

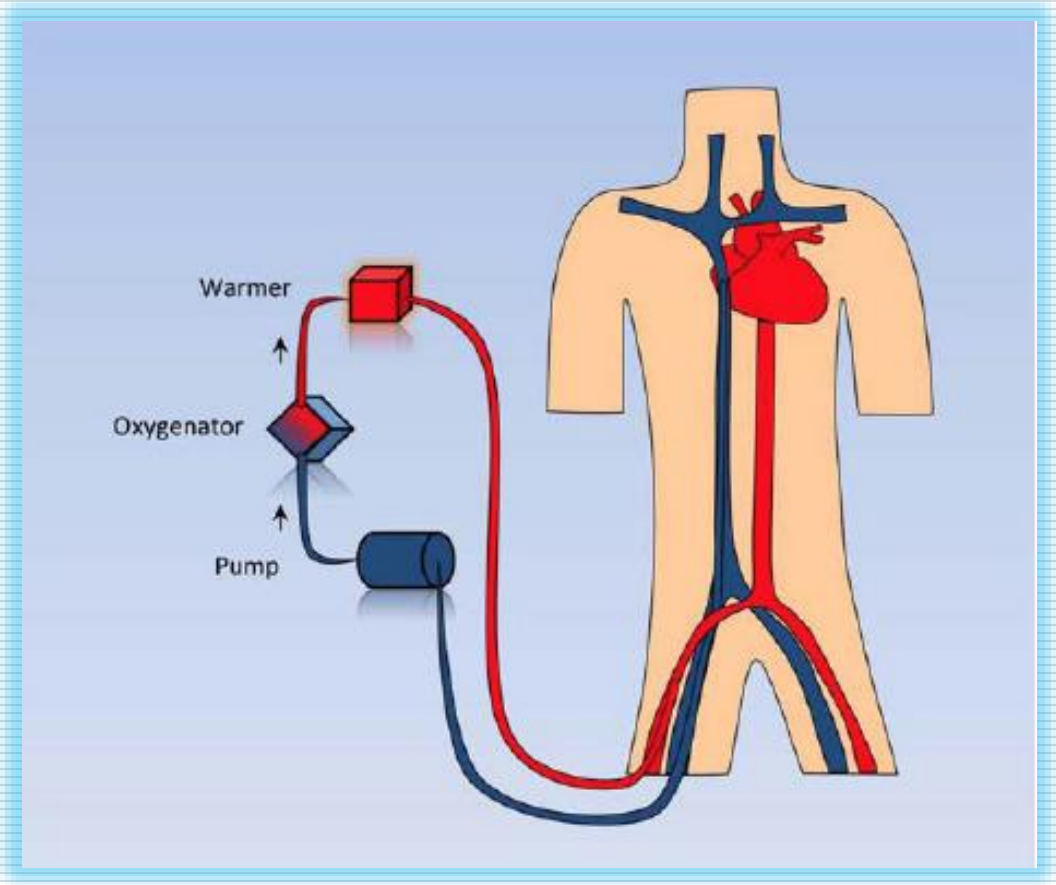


90-day MACE over the course of the trial



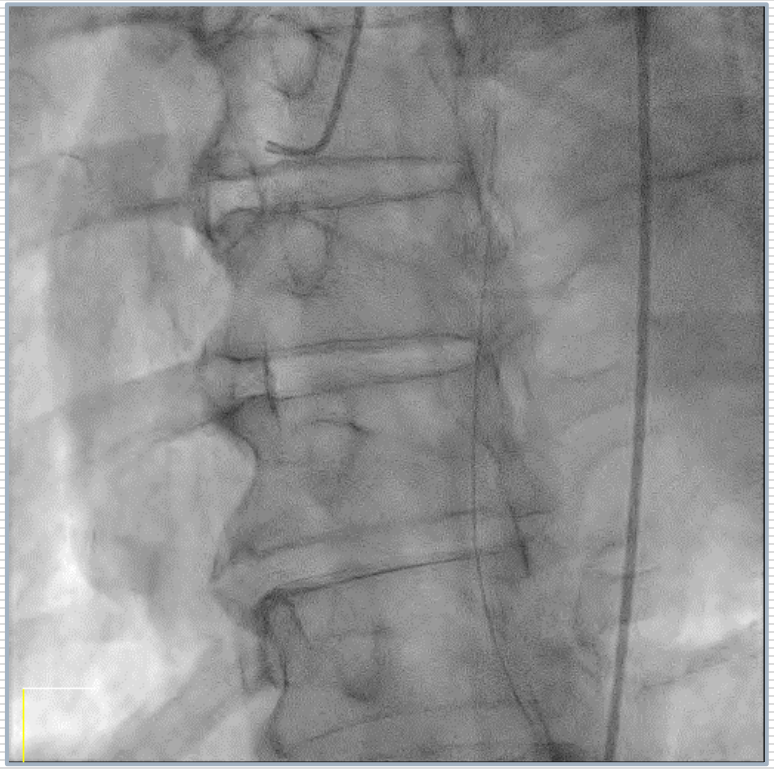
Circulation 2012;126:1717-1727

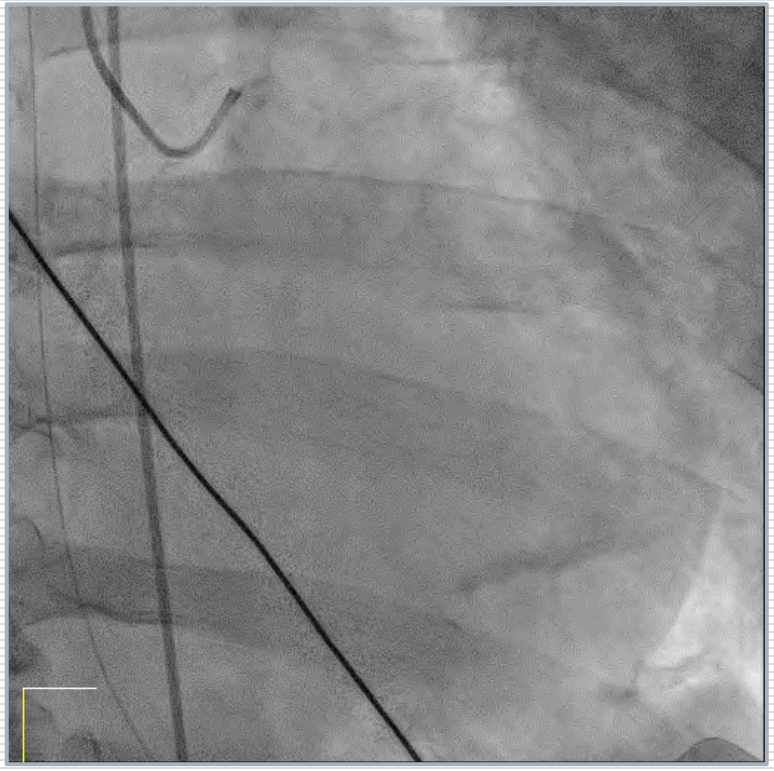
VA ECMO



- VA-ECMO withdraws venous blood and returns it to the arterial system via a centrifugal pump
- Providing gas exchange, oxygenation, and circulatory support
- Useful in patients with cardiogenic shock and impaired oxygenation
- Reducing biventricular preload and increasing mean arterial pressure
- May increase LV afterload, thereby often needing LV venting strategies

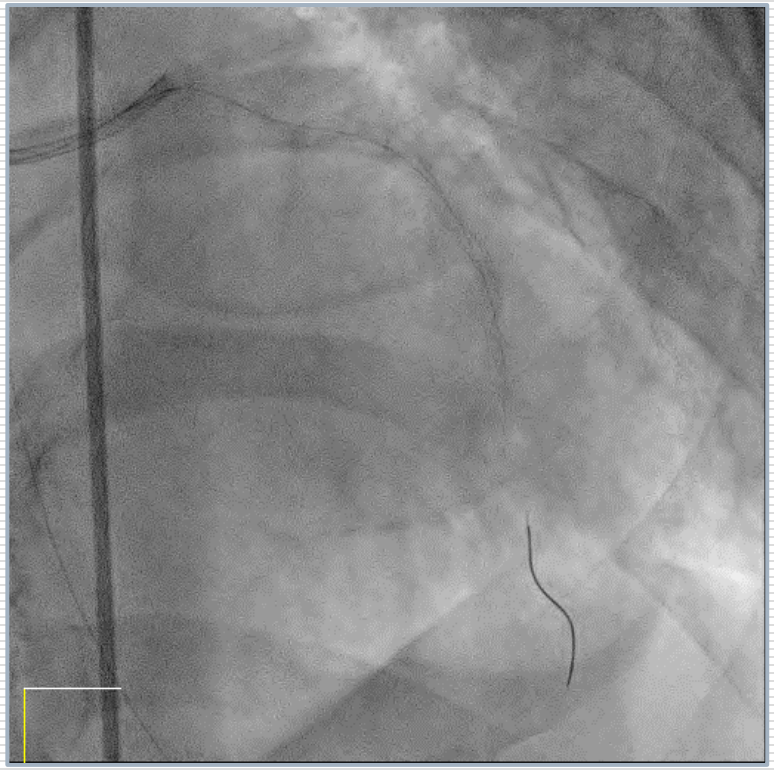
Case: 69-Year-Old Male

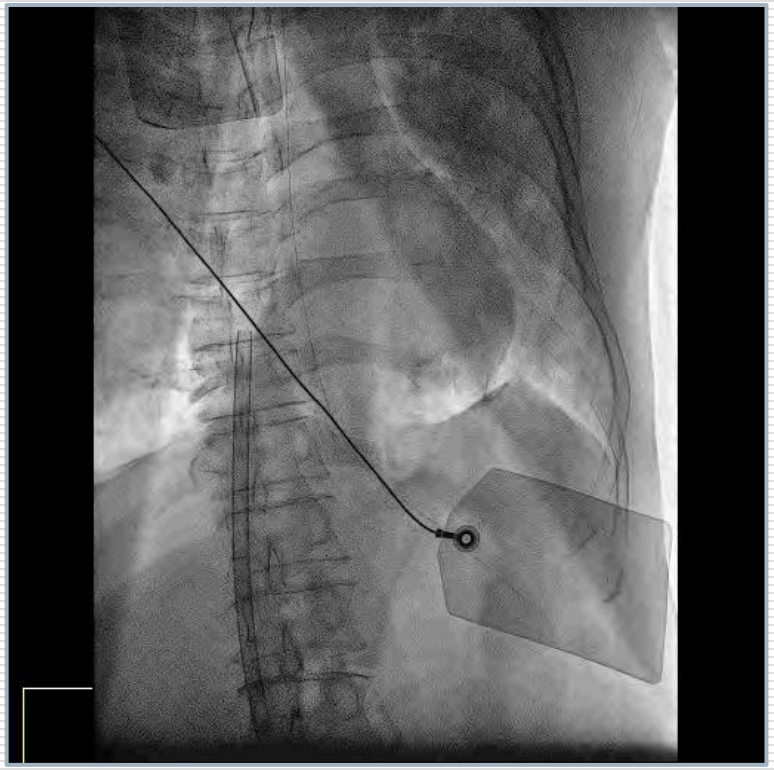




- Acute STEMI
- Aborted cardiac arrest (VF)
- BP : 80/50 mmHg, HR: 115 bpm on norepinephrine
- LVEF = 25-30%
- Thrombotic occlusion at pLAD
- Concomitant CTO at mRCA

Case: 69-Year-Old Male: Emergent VA ECMO and Primary PCI





- Emergent VA ECMO
- Trans-femoral 7F
- DES #2

Outcomes of VA-ECMO by Cardiac Indication

Reference	Population	Design	Duration (days)	Key Results
Post-cardiotomy				
Rastan et al. 2010 (Online Ref. 1)	N = 517, refractory shock, mixed procedures	Prospective cohort, multicenter	3.3 ± 2.9	Weaned: 63% In-hospital mortality: 75% Survival: 6 months 18%, 1 yr 17%, 5 yrs 14%
Biancari et al. 2017 (Online Ref. 2)	N = 148, shock or respiratory failure after isolated CABG	Retrospective cohort, multicenter	6.4 ± 5.6	Weaned: 49% In-hospital mortality: 64% Survival: 1 yr 31%, 2 yrs 28%, 3 yrs 26%
Post-transplantation				
D'Alessandro et al. 2010 (Online Ref. 3)	N = 54, recipients with early graft failure for any cause	Retrospective cohort, single-center	7 ± 3	Weaned: 67% In-hospital mortality: 50% Survival: 1 yr 73%
Marasco et al. 2010 (Online Ref. 4)	N = 39, recipients with primary graft failure	Retrospective cohort, single-center	6.8 ± 2.6	Weaned: 87% In-hospital mortality: 26% Survival: 1 yr 73%
CS				
Xie et al. 2015 (Online Ref. 5)	N = 1,199 (22 studies), CS or CA	Meta-analysis	NR	In-hospital mortality: 60% (95% CI: 53%–66%) Survival: 3 months 56%, 1 yr 54% Survival at 1 month CS 53% vs. CA 36%
Dangers et al. 2017 (Online Ref. 6)	N = 105, ADHF	Prospective cohort, single-center	NR	Survival: 1 yr 42% (many received a transplant)
Myocarditis				
Cheng et al. 2014 (Online Ref. 7)	N = 170, acute myocarditis	Meta-analysis	NR	In-hospital mortality: 33% (95% CI: 26%–41%)
Cardiac arrest				
Maekawa et al. 2013 (Online Ref. 8)	N = 53, out-of-hospital CA with CPR >20 min	Prospective cohort, propensity matched	NR	Survival to discharge: ECMO 38% vs. CPR 13% (p = 0.09) Survival: 3-month. ECMO 38% vs. CPR 8% (p = 0.04)
Choi et al. 2016 (Online Ref. 9)	N = 320, out-of-hospital CA in South Korea	Retrospective cohort, propensity matched	NR	Survival to discharge: ECMO 18% vs. CPR 16% (ECMO adjusted OR: 0.61; 95% CI: 0.39–0.94)
Mixed				
Chang et al. 2016 (Online Ref. 10)	N = 4,227, supported in Taiwan	Retrospective cohort, administrative	2 ± 1	In-hospital mortality: 65% Survival: 1 month 40%, 1 yr 23%
Batra et al. 2016 (Online Ref. 11)	N = 1,286, supported in New York state	Retrospective cohort, administrative	NR	In-hospital mortality: 54% Survival: 1 month 48%, 1 yr 38%
Aso et al. 2016 (Online Ref. 12)	N = 5,263, supported in Japan	Retrospective cohort, administrative	NR	Weaned: 64% In-hospital mortality: 73% (shock 74%, PE 64%)

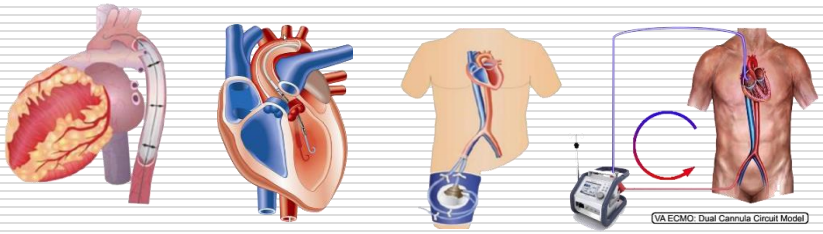
Summary

- In unstable patients undergoing high risk PCI, elective IABP (with/without VA-ECMO) can be used as first-line hemodynamic support device(s) here in Korea (where Impella is not available).
- In patients with pre-shock or shock at an early stage, IABP may be used.
- In patients with cardiogenic shock with severe LV failure, Impella or Tandem Heart are appropriate hemodynamic support devices. However, VA-ECMO is an inevitable choice in Korea. VA-ECMO and concomitant use of IABP may be helpful to decrease mortality compared with VA-ECMO alone.
- With current available data, we can not say there is an obvious survival benefit with hemodynamic support device in CHIP.



Intraaortic Balloon Support for Myocardial Infarction with Cardiogenic Shock (IAPB-SHOCK 2 Trial)

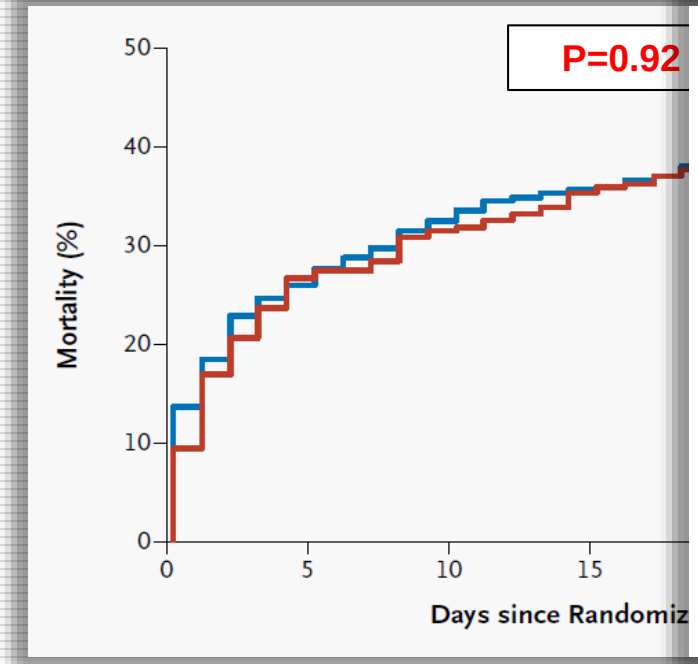
600 Patients with cardiogenic shock complication acute MI.
All patients were expected to undergo early revascularization

1 → IAPB, n= 301 (300)

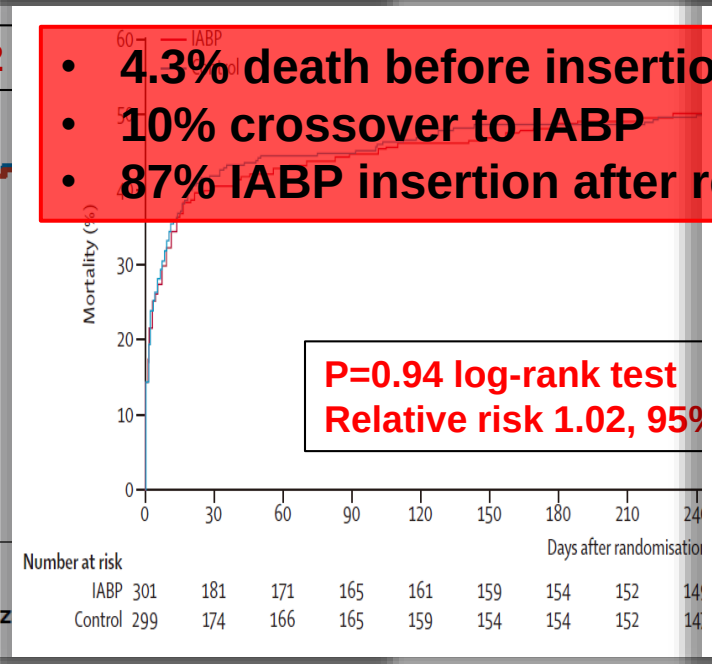
1 → Control, n=299 (298)

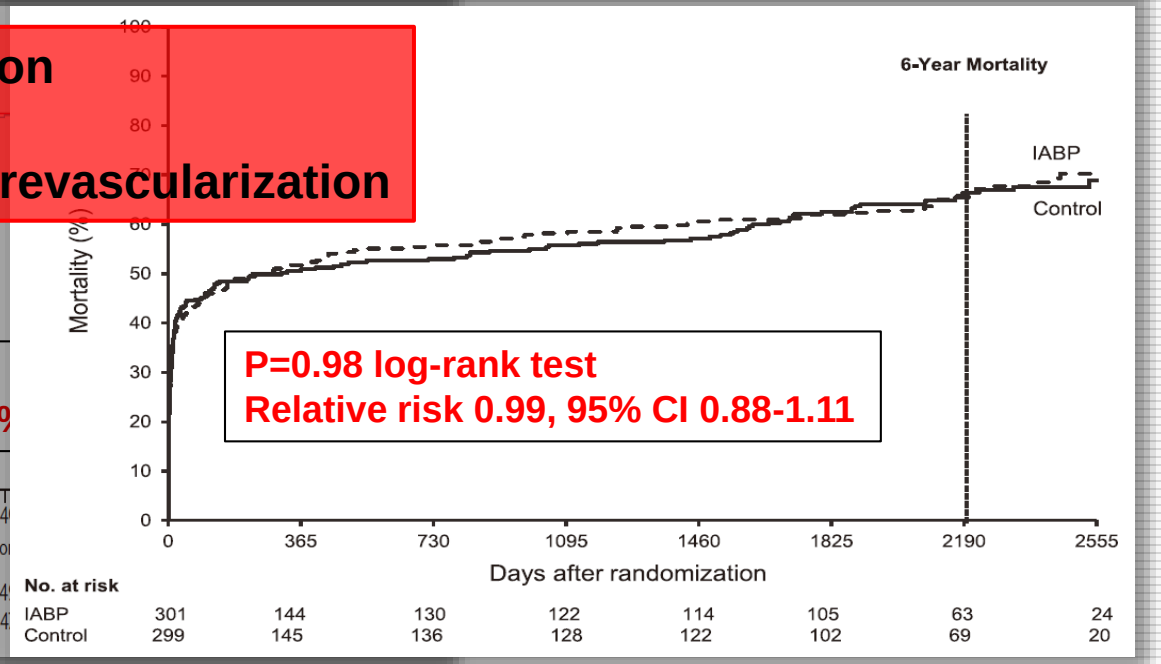
- Primary efficacy endpoint : 30-day all-cause mortality
- Safety assessment: major bleeding, peripheral ischemic complications, sepsis, and stroke

Primary efficacy endpoint (30-day a | **12-month all-cause m** | **6-year all-cause mortality**



- 4.3% death before insertion
- 10% crossover to IABP
- 87% IABP insertion after revascularization





New Engl J Med 2012;367:1287-1296, Lancet 2013; 382:1638-1645, Circulation 2019;139:395-403.
